

# Enable HiDPI aware web viewer for FileMaker

With latest pre-release we added the [WebView.SetInternetExplorerHiDPI](#) function to switch on the HiDPI aware more for FileMaker application (or runtime). See comparison picture:

In your start script you can just call this function once to enable it:

```
MBS( "WebView.SetInternetExplorerHiDPI"; 1 )
```

When this option is active before web viewer is created, the web control will display the content high-dpi aware and zoom to 100% independent of the DPI of the display.

In earlier blog post we recommended to use JavaScript to zoom the website:

```
MBS( "WebView.RunJavaScript"; "web"; "document.body.style.zoom = \"200%\"; ")
```

But this is no longer needed on Windows once the web viewer zooms correctly.
