

Monkeybread FileMaker Plugin Documentation

Christian Schmitz

March 8, 2020

0.1 Introduction

This is the PDF version of the documentation for the FileMaker Plug-in from Monkeybread Software Germany.

0.2 Content

• 1 List of all topics	5
• 3 List of all functions	13
• 4 Functions for Mac OS X	223
• 5 Functions for Windows	415
• 6 Functions for Server	553
• 7 New in version 6.0	675
• 8 New in version 6.1	679
• 9 New in version 6.2	685
• 10 New in version 6.3	695
• 11 New in version 6.4	699
• 12 New in version 6.5	703
• 13 New in version 7.0	711
• 14 New in version 7.1	715
• 15 New in version 7.2	719
• 16 New in version 7.3	725
• 17 New in version 7.4	733
• 18 New in version 7.5	739
• 19 New in version 8.0	743
• 20 New in version 8.1	747
• 21 New in version 8.2	749
• 22 New in version 8.3	755
• 23 New in version 8.4	759
• 24 New in version 8.5	763
• 25 New in version 9.0	769

<i>0.2. CONTENT</i>	3
• 26 New in version 9.1	773
• 27 New in version 9.2	777
• 28 New in version 9.3	783
• 29 New in version 9.4	785
• 30 New in version 9.5	789
• 31 New in version 10.0	791
• 32 New in version 10.1	797

Chapter 1

List of topics

• 33 Addressbook	799
• 34 App	909
• 35 AppleScript	925
• 36 Archive	943
• 37 Audit	955
• 38 AVAsset	987
• 39 AVExport	1027
• 40 AVPlayer	1057
• 41 AVRecorder	1089
• 42 Backdrop	1135
• 43 Barcode	1137
• 44 BinaryFile	1171
• 45 BlueThermProbe	1201
• 46 Bonjour	1223
• 47 Calendar	1229
• 48 Certificates	1345
• 49 CGImageSource	1383
• 50 CLGeocoder	1415
• 51 Clipboard	1435

• 52 ColorPanel	1461
• 53 Compression	1473
• 54 Contacts	1527
• 55 Container	1605
• 56 ContinuityCamera	1661
• 57 CoreImage	1667
• 58 CoreLocation	1669
• 59 CoreML	1709
• 60 CUPS	1733
• 61 CURL	1761
• 62 Debugger	2333
• 63 Dialog	2339
• 64 DialogModifications	2393
• 65 Dictionary	2397
• 66 DirectoryWatcher	2437
• 67 DNSLookup	2451
• 68 DocumentCameraScan	2463
• 69 DragDrop	2479
• 70 DynaPDF	2549
• 71 EIDSDK	3367
• 72 EmailParser	3403
• 73 Encryption	3445
• 74 EnvironmentVariables	3485
• 75 EventMonitor	3493
• 76 Events	3505
• 77 FileDialog	3709
• 78 Files	3771
• 79 FM	3883
• 80 FMSQL	4065

• 81 Folders	4169
• 82 Font	4193
• 83 FSEvents	4205
• 84 GameKit	4239
• 85 GraphicsMagick	4337
• 86 Hash	4785
• 87 HealthKit	4817
• 88 HotKey	4831
• 89 IKPictureTaker	4859
• 90 IKSlideShow	4891
• 91 ImageCapture	4921
• 92 ImagePicker	5033
• 93 ImageView	5091
• 94 iOSApp	5113
• 95 iOSDevice	5133
• 96 iOSKeyboard	5147
• 97 Java	5157
• 98 JavaScript	5181
• 99 JavaScriptMac	5215
• 100 JSON	5231
• 101 Keychain	5357
• 102 LDAP	5363
• 103 List	5417
• 104 ListDialog	5563
• 105 MailComposer	5609
• 106 MapView	5637
• 107 Markdown	5749
• 108 Math	5753
• 109 Matrix	5779

• 110 MatrixDongle	5823
• 111 MediaLibraryBrowser	5847
• 112 Menu	5853
• 113 Menubar	5993
• 114 MessageComposer	6005
• 115 MetaDataQuery	6031
• 117 NetworkInterfaces	6089
• 118 Notification	6095
• 119 NSEventFilter	6103
• 120 OCR	6109
• 121 Path	6135
• 122 PDFKit	6153
• 123 PHP	6247
• 124 Plugin	6261
• 125 PortMidi	6341
• 126 Preferences	6373
• 127 PrintDialog	6383
• 128 Printer	6449
• 129 Process	6477
• 130 ProgressDialog	6493
• 131 Proj	6545
• 134 QuickLook	6615
• 135 RegEx	6643
• 136 Registry	6679
• 137 RemoteControl	6693
• 138 RichText	6713
• 139 RunTask	6755
• 140 Schedule	6785
• 141 Screenshot	6837

• 142 ScriptWorkspace	6849
• 143 SendMail	6875
• 144 SerialPort	6931
• 145 ServerSocket	6983
• 146 ServiceProvider	6993
• 147 SharedMemory	6997
• 148 Shell	7001
• 149 Sign	7061
• 150 SmartCard	7087
• 151 SNMP	7123
• 152 Social	7127
• 153 SocialComposer	7159
• 154 Socket	7185
• 155 Speech	7275
• 156 SQL	7291
• 157 SSH	7479
• 158 StoreKit	7537
• 159 SyntaxColoring	7553
• 160 System	7647
• 161 SystemInfo	7651
• 162 SystemUIMode	7719
• 163 TAPI	7725
• 164 Text	7767
• 165 TextView	7877
• 166 Time	7925
• 167 Toolbar	7937
• 168 TouchBar	7959
• 169 Twain	7987
• 170 UNNotification	8065

• 171 Updater	8129
• 172 URLScheme	8141
• 173 USB	8147
• 174 UserNotification	8157
• 175 Utility	8229
• 176 UUID	8247
• 177 Validate	8255
• 178 Variables	8259
• 179 Vision	8273
• 180 WebView	8281
• 181 WIA	8493
• 182 Window	8531
• 183 WindowsScript	8675
• 184 WindowsUserNotification	8711
• 185 WindowTransition	8733
• 186 WinSendMail	8739
• 187 WMFP	8767
• 188 WMIQuery	8801
• 189 WordFile	8813
• 190 XL	8849
• 191 XML	9253

Chapter 5

Functions compatible with Windows

• 41.1 AVRecorder.AddPreviewToWindow	1089
• 41.2 AVRecorder.AudioDeviceCount	1091
• 41.3 AVRecorder.AudioDeviceInfo	1092
• 41.5 AVRecorder.CaptureStillPhoto	1095
• 41.6 AVRecorder.ClosePreview	1097
• 41.8 AVRecorder.EncoderCount	1099
• 41.9 AVRecorder.EncoderInfo	1100
• 41.10 AVRecorder.GetAudioDevice	1101
• 41.12 AVRecorder.GetEncoder	1103
• 41.13 AVRecorder.GetFilePath	1104
• 41.14 AVRecorder.GetVideoDevice	1105
• 41.17 AVRecorder.Init	1108
• 41.18 AVRecorder.IsRecording	1111
• 41.20 AVRecorder.Release	1113
• 41.22 AVRecorder.SetAudioDevice	1115
• 41.24 AVRecorder.SetEncoder	1117
• 41.25 AVRecorder.SetFilePath	1118
• 41.27 AVRecorder.SetVideoDevice	1121
• 41.29 AVRecorder.ShowPropertyDialog	1123

- 41.30 AVRecorder.StartPreview 1125

44 functions.

Chapter 33

Addressbook

Functions for the Mac OS X addressbook.

You can use this to sync contacts from FileMaker database to system addressbook. As your addressbook can be synchronized via iCloud to iPhones or via Google/Exchange to any other devices, you only need one Mac to sync contacts to devices.

On Server you can only use addressbook functions if you got a addressbook for the user account where the server runs. Normally the server user account has no addressbook. For 32-bit and 64-bit Mac application.

See contacts functions for newer API which works better with multiple accounts.

33.1 Addressbook.Account.Name

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.Account.Name"; Account)

Parameters

Account

The account identifier for this account.

\$account

Result Returns text or error.

Description

Examples

Query name of local account:

MBS("Addressbook.Account.Name"; "_local")

See also

- 33.2 Addressbook.Account.Type 801
- 33.3 Addressbook.Account.URL 802
- 33.20 Addressbook.allAccounts 822
- 33.21 Addressbook.defaultAccount 823
- 33.22 Addressbook.enabledAccounts 824
- 33.56 Addressbook.persistentAccounts 868
- 33.18 Addressbook.Record.Account 818

Created 17th March 2016, last changed 17th March 2016.

33.2 Addressbook.Account.Type

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.Account.Type"; Account)

Parameters

Account

The account identifier for this account.

\$account

Result Returns text or error.

Description

See also

- [33.1 Addressbook.Account.Name](#) 799
- [33.3 Addressbook.Account.URL](#) 802
- [33.20 Addressbook.allAccounts](#) 822
- [33.21 Addressbook.defaultAccount](#) 823
- [33.22 Addressbook.enabledAccounts](#) 824
- [33.56 Addressbook.persistentAccounts](#) 868

Created 17th March 2016, last changed 17th March 2016.

33.3 Addressbook.Account.URL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.Account.URL"; Account)

Parameters

Account

The account identifier for this account.

\$account

Result Returns URL or error.

Description

See also

- 33.1 Addressbook.Account.Name 799
- 33.2 Addressbook.Account.Type 801
- 33.20 Addressbook.allAccounts 822
- 33.21 Addressbook.defaultAccount 823
- 33.22 Addressbook.enabledAccounts 824
- 33.56 Addressbook.persistentAccounts 868

Created 17th March 2016, last changed 17th March 2016.

33.4 Addressbook.Account.isMainAccount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.Account.isMainAccount"; Account)

Parameters

Account

The account identifier for this account.

\$account

Result Returns 1, 0 or error.

Description

Returns 1 if main or 0 if not.

See also

- 33.20 Addressbook.allAccounts 822
- 33.21 Addressbook.defaultAccount 823
- 33.22 Addressbook.enabledAccounts 824
- 33.56 Addressbook.persistentAccounts 868

Created 17th March 2016, last changed 17th March 2016.

33.5 Addressbook.LocalizedPropertyOrLabel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.LocalizedPropertyOrLabel"; key)

Parameters

key

The identifier for label or property.

"Creation"

Result Returns localized name.

Description

Examples

Query localized name of PhoneProperty

MBS("Addressbook.LocalizedPropertyOrLabel"; "PhoneProperty")

Example result: "Telefon" in Germany

Created 18th August 2014, last changed 11st December 2016.

33.6 Addressbook.NewGroup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.NewGroup")

Result Returns ID for new group.

Description

This group has no ID assigned until you save it to the addressbook. So the plugin returns a special ID where the plugin knows that when you change the group, you refer to the new group.

Address book item reference numbers are starting at 26000 and counting up for each new item.

Examples

Create group and save changes:

```
$groupID = MBS( "Addressbook.NewGroup" )
$r = MBS( "Addressbook.record.SetValueForProperty"; $groupID; "GroupNameProperty"; "Friends" )
$r = MBS( "Addressbook.addRecord"; $groupID )
$r = MBS( "Addressbook.save" )
```

See also

- 33.19 Addressbook.addRecord 819
- 33.31 Addressbook.groups 833
- 33.7 Addressbook.NewPerson 806
- 33.68 Addressbook.record.SetValueForProperty 880
- 33.76 Addressbook.save 896

Created 18th August 2014, last changed 5th April 2016.

33.7 Addressbook.NewPerson

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.NewPerson")

Result Returns ID for new person.

Description

This person has no ID assigned until you save it to the addressbook. So the plugin returns a special ID where the plugin knows that when you change the person, you refer to the new person.

Address book item reference numbers are starting at 26000 and counting up for each new item.

Examples

Create person and save changes:

```
$personID = MBS( "Addressbook.NewPerson" )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; "John" )
$r = MBS( "Addressbook.addRecord"; $personID )
$r = MBS( "Addressbook.save" )
```

Add a new person to addressbook.

```

Example Databases

- [Mac and iOS/Addressbook/Addressbook](#)

Created 18th August 2014, last changed 18th October 2016.

33.8 Addressbook.Notification.Clear

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.Clear")

Result Returns OK.

Description

Examples

Clears script:

MBS("Addressbook.Notification.Clear")

See also

- [33.9 Addressbook.Notification.Evaluate](#) 809
- [33.17 Addressbook.Notification.Set](#) 817

Created 18th August 2014, last changed 18th August 2014.

33.9 Addressbook.Notification.Evaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.Notification.Evaluate"; Expression)

Parameters

Expression

The expression to evaluate.

"Let (\$\$Done = 1 ; 1)"

Result Returns OK or error.

Description

This expression is evaluated whenever something in the addressbook database changed.

See also

- [33.8 Addressbook.Notification.Clear](#) 808
- [33.17 Addressbook.Notification.Set](#) 817

33.9.1 Blog Entries

- [MBS FileMaker Plugin, version 6.2pr2](#)

Created 29th March 2016, last changed 29th March 2016.

33.10 Addressbook.Notification.GetChangedExternally

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.GetChangedExternally")

Result Returns 1 or 0.

Description

If this function returns zero, the change was made by your own FileMaker solution.

This property is not always set by the OS for all changes, especially with some sync services.

See also

- [47.80 Calendar.Notification.GetChangedExternally](#) 1321

Example Databases

- [Mac and iOS/Addressbook/Addressbook Changes](#)

Created 18th August 2014, last changed 12nd January 2015.

33.11 Addressbook.Notification.GetDeletedRecords

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.GetDeletedRecords")

Result Returns list of record IDs.

Description

Only valid in a notification script.

Please note that the plugin may not be able to provide information for deleted record contents.

See also

- [33.12 Addressbook.Notification.GetInsertedRecords](#) 812

33.13 Addressbook.Notification.GetProcessID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.GetProcessID")

Result Returns proces identifier.

Description

In a notification script you can use this function to learn who made the change for external changes. For notifications caused by your own solution, this value may be undefined.

See also

- 33.14 Addressbook.Notification.GetProcessName 814
- 33.16 Addressbook.Notification.GetUserUID 816
- 47.83 Calendar.Notification.GetProcessID 1324

Example Databases

- [Mac and iOS/Addressbook/Addressbook Changes](#)

Created 18th August 2014, last changed 18th August 2014.

33.14 Addressbook.Notification.GetProcessName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.GetProcessName")

Result Returns process name.

Description

In a notification script you can use this function to learn who made the change for external changes. For notifications caused by your own solution, this value may be undefined.

See also

- [33.13 Addressbook.Notification.GetProcessID](#) 813

Example Databases

- [Mac and iOS/Addressbook/Addressbook Changes](#)

Created 18th August 2014, last changed 18th August 2014.

33.15 Addressbook.Notification.GetUpdatedRecords

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.GetUpdatedRecords")

Result Returns list of record IDs.

Description

Only valid in a notification script.

See also

- [33.11 Addressbook.Notification.GetDeletedRecords](#) 811
- [33.12 Addressbook.Notification.GetInsertedRecords](#) 812
- [47.85 Calendar.Notification.GetUpdatedRecords](#) 1326

Example Databases

- [Mac and iOS/Addressbook/Addressbook Changes](#)

Created 18th August 2014, last changed 18th August 2014.

33.16 Addressbook.Notification.GetUserUID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.GetUserUID")

Result Returns user ID as number.

Description

In a notification script you can use this function to learn who made the change for external changes. For notifications caused by your own solution, this value may be undefined.

See also

- [33.13 Addressbook.Notification.GetProcessID](#) 813

Example Databases

- [Mac and iOS/Addressbook/Addressbook Changes](#)

Created 18th August 2014, last changed 18th August 2014.

33.17 Addressbook.Notification.Set

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.Notification.Set"; FileName; ScriptName)

Parameters

FileName

The name of the FileMaker File that contains the script.

"test.fmp12"

ScriptName

The name of the script to run.

"MyScript"

Result Returns OK on success.

Description

This script is called whenever something in the addressbook database changed.

With plugin version 6.0 or newer the script name can be a script ID number. In that case the plugin queries the script name for the given script ID. This allows to call scripts by ID and avoid problems if scripts are later renamed.

Examples

Installs notification script:

MBS("Addressbook.Notification.Set"; "test.fp7"; "MyScript")

See also

- [33.8 Addressbook.Notification.Clear](#) 808
- [33.9 Addressbook.Notification.Evaluate](#) 809
- [33.16 Addressbook.Notification.GetUserUID](#) 816

Example Databases

- [Mac and iOS/Addressbook/Addressbook Changes](#)

Created 18th August 2014, last changed 24th October 2018.

33.18 Addressbook.Record.Account

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.Record.Account"; RecordID)

Parameters

RecordID

The unique ID for the target person or group.

\$personID

Result Returns account identifier or error.

Description

Examples

Query account for me:

```
MBS( "Addressbook.Record.Account"; MBS( "Addressbook.me" ) )
```

Query account name for me:

```
MBS( "Addressbook.Account.name"; MBS( "Addressbook.Record.Account"; MBS( "Addressbook.me" ) ) )
```

33.19 Addressbook.addRecord

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.addRecord"; RecordID)

Parameters

RecordID

The unique ID for the target person or group.

\$personID

Result Returns OK or error message.

Description

You may want to call Addressbook.save later to saves changes permanently.

Examples

Create person and save changes:

```
$personID = MBS( "Addressbook.NewPerson" )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; "John" )
$r = MBS( "Addressbook.addRecord"; $personID )
$r = MBS( "Addressbook.save" )
```

Add a new person to addressbook.

```
# Fields to variables
#

33.20 Addressbook.allAccounts

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.allAccounts")

Result Returns list or error.

Description

Examples

Show all accounts:

```
Set Variable [ $accounts; Value:MBS( "Addressbook.allAccounts" ) ]
Set Variable [ $count; Value:ValueCount($accounts) ]
Set Variable [ $index; Value:1 ]
Loop
Set Variable [ $account; Value:GetValue($accounts; $index) ]

33.23 Addressbook.formattedAddress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	No

MBS("Addressbook.formattedAddress"; address)

Parameters

address

The dictionary containing a street address. Same format as Addressbook.record.valueForProperty returns.
\$address

Result Returns formatted address text or error.

Description

The address is usually defined by plugin to have keys like Street, City, State, Country or Zip followed by an equal sign and the actual value.

See also

- 33.73 Addressbook.record.valueForProperty

33.24 Addressbook.group.addMember

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.group.addMember"; GroupID; PersonID)

Parameters

GroupID

The unique ID for the target group.

\$groupID

PersonID

The unique ID for the person to be added to the group.

\$personID

Result Returns 1 for success or 0 for failure on Mac. Returns OK on success and error on failure on iOS.

Description

If the person argument is already part of the group, this method does nothing and returns OK.

Prior to OS X v10.6, if the person record is already in the group, this method does nothing and returns failure.

Examples

Add person to group:

```
# add to group
Set Variable [ $r ; Value: MBS( "Addressbook.group.addMember"; "Best Friends"; $PersonID ) ]
# save changes
Set Variable [ $r ; Value: MBS( "Addressbook.save"; $personID ) ]
```

Created 18th August 2014, last changed 6th November 2017.

33.25 Addressbook.group.addSubgroup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.group.addSubgroup"; GroupID; SubGroupID)

Parameters

GroupID

The unique ID for the target group.

\$groupID

SubGroupID

The unique ID for the subgroup.

\$subgroupID

Result Returns 1 for success or 0 for failure on Mac. Returns OK on success and error on failure on iOS.

Description

If the group argument is already part of the group, this method does nothing and returns Failure. If adding the group would create a recursion, this method also does nothing and returns Failure. (For example, if the group Animal Lovers is in Dog Lovers, and you add Dog Lovers to Animal Lovers, that would create a recursion, which this method won't allow.)

Created 18th August 2014, last changed 6th November 2017.

33.26 Addressbook.group.members

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.group.members"; GroupID)

Parameters

GroupID

The unique ID for the target group.

\$groupID

Result Returns list of person IDs.

Description

If this group doesn't contain any people, this method returns an empty array.

Since version 5.3 you can pass group names for GroupID and plugin lookups ID for you.

Examples

Query group members:

MBS("Addressbook.group.members" ; "Family")

33.27 Addressbook.group.parentGroups

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	No

MBS("Addressbook.group.parentGroups"; GroupID)

Parameters**GroupID**

The unique ID for the target group.

\$groupID

Result Returns list of parent group IDs.

Description

If this group doesn't belong to any groups, this method returns an empty array.

See also

- 33.25 Addressbook.group.addSubgroup 827

33.28 Addressbook.group.removeMember

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.group.removeMember"; GroupID; PersonID)

Parameters

GroupID

The unique ID for the target group.

\$groupID

PersonID

The unique ID for the target person.

\$personID

Result Returns 1 for success or 0 for failure on Mac. Returns OK on success and error on failure on iOS.

Description

If the person argument is not in the group, this method does nothing and returns Failure.

See also

- 33.24 Addressbook.group.addMember 826

33.29 Addressbook.group.removeSubgroup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.group.removeSubgroup"; GroupID; SubGroupID)

Parameters**GroupID**

The unique ID for the target group.

\$groupID

SubGroupID

The unique ID for the subgroup to remove.

\$subgroupID

Result Returns 1 for success or 0 for failure on Mac. Returns OK on success and error on failure on iOS.

Description

If the group argument is not a subgroup, this method does nothing and returns Failure.

33.30 Addressbook.group.subgroups

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	No

MBS("Addressbook.group.subgroups"; GroupID)

Parameters

GroupID

The unique ID for the target group.

\$groupID

Result Returns list of group IDs.

Description

If this group doesn't contain any groups, this method returns an empty array.

See also

- 33.25 Addressbook.group.addSubgroup 827

Created 18th August 2014, last changed 18th August 2014.

33.31 Addressbook.groups

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

```
MBS( "Addressbook.groups" { ; Account } )
```

Parameters

Account

Optional

The account identifier to limit search for.

_local

Result Returns list of group IDs.

Description

If the database doesn't contain any groups, this method returns an empty array.

You can use `Addressbook.record.displayname` to find the display name of a group. Or you query the group name property with `Addressbook.record.valueForProperty`.

Examples

Query list of group IDs:

```
MBS( "Addressbook.groups" )
```

Query display name of first group:

```
MBS( "Addressbook.record.displayname"; ElementLeft ( MBS( "Addressbook.groups" ) ; 1 ) )
```

33.32 Addressbook.hasUnsavedChanges

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.hasUnsavedChanges")

Result Returns 1 if there are unsaved changes; otherwise, 0.

Description

The unsaved changes flag is set automatically whenever changes are made.
Created 18th August 2014, last changed 18th August 2014.

33.33 Addressbook.me

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.me")

Result Returns ID of person.

Description

If the user never specified such a record, this method returns empty string.

Examples

Query ID of the owner's record:

```
MBS( "Addressbook.me" )
```

Example result: "B895CE29-B747-4D28-8981-690C358F8A3D:ABPerson"

Show me in addressbook:

```
$id = MBS("Addressbook.me")
$r = MBS( "Addressbook.person.ShowInAddressbook"; $id)
```

Created 18th August 2014, last changed 11st December 2016.

33.34 Addressbook.multivalued.New

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalued.New" { ; Addresses })

Parameters

Addresses

Optional

Whether you want to store address information. Pass 1 if you plan to use this multivalued with AddressProperty.

1

Result Returns OK on success and error on failure.

Description

You create such a MultiValue object, add values to it and then use Addressbook.record.SetValueForProperty to assign it to a record.

Examples

Add a new URL to a contact:

```
Set Variable [ $r; MBS( "Addressbook.multivalued.New" ) ]
Set Variable [ $ID; MBS( "Addressbook.multivalued.addValue"; "http://www.mbsplugins.de"; "WorkLabel" ) ]
Set Variable [ $r; MBS( "Addressbook.multivalued.setPrimaryIdentifier"; $ID ) ]
Set Variable [ $r; MBS( "Addressbook.record.SetValueForProperty"; $personID; "URLsProperty"; "multivalued" ) ]
```

Add work and home emails:

```
$r = MBS( "Addressbook.multivalued.New" )
$WorkEmailID = MBS( "Addressbook.multivalued.addValue"; Addressbook::WorkEmail; "EmailWorkLabel" )
$HomeEmailID = MBS( "Addressbook.multivalued.addValue"; Addressbook::HomeEmail; "EmailHomeLabel" )
$r = MBS( "Addressbook.multivalued.setPrimaryIdentifier"; $WorkEmailID )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "multivalued" )
```

Add an address:

```
Set Variable [ $result; Value:MBS ( "Addressbook.multivalued.New"; 1 ) ]
Set Variable [ $id; Value:MBS ( "Addressbook.multivalued.addAddress"; $str; $plz; $ort; $land; "" ; "" ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.multivalued.setPrimaryIdentifier"; $id ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "AddressProperty"; "multivalued" ) ]
```

Add an email:

```
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.New" )
Set Variable [ $id; Value:MBS ( "Addressbook.multivalue.addValue"; $email; "EmailWorkLabel" ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.setPrimaryIdentifier"; $id ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "multivalue" ) ]
```

Add phone numbers:

```
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.New" ) ]
Set Variable [ $tel_id; Value:MBS ( "Addressbook.multivalue.addValue"; $tel; "PhoneWorkLabel" ) ]
Set Variable [ $mob_id; Value:MBS ( "Addressbook.multivalue.addValue"; $mob; "PhoneMobileLabel" ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.setPrimaryIdentifier"; $mob_id ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "PhoneProperty"; "multivalue" ) ]
```

33.35 Addressbook.multivalue.addAddress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	5.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.addAddress"; label; street; zip; city; country; countrycode; state)

Parameters**label**

The label to associate with the value.

"Work"

street

The street for the address. Can be empty if unknown.

"Main Street 123"

zip

The zip code for the address. Can be empty if unknown.

"12345"

city

The city for the address. Can be empty if unknown.

"Springfield"

country

The country for the address. Can be empty if unknown.

"Germany"

countrycode

The country code for the address. Can be empty if unknown.

"US"

state

The state for the address. Can be empty if unknown.

"CA"

Result Returns identifier or error.

Description

Only useful for addresses.

Returns the new identifier if value is added successfully; otherwise, nil.

Values which are empty text are not added to the address.

Examples

Creates a new address:

```
MBS( "Addressbook.multivalue.addAddress"; "AddressHomeLabel"; "Main Street 123"; "12345"; "Springfield"; "USA" )
```

Adds address without zip code:

MBS("Addressbook.multivalue.addAddress"; "Work"; "Hlíðarbyggð"; ""; "Garðabær"; "Island"; ""; "IS")

33.36 Addressbook.multivalue.addValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.addValue"; value; label)

Parameters

value

The value to add.

"test@test.test"

label

The label to associate with the value.

"Work"

Result Returns identifier or error.

Description

Returns the new identifier if value is added successfully; otherwise, nil.

Possible labels are:

kABHomePageLabel, kABEmailWorkLabel, kABEmailHomeLabel, kABAddressHomeLabel, kABAddressWorkLabel, kABAnniversaryLabel, kABFatherLabel, kABMotherLabel, kABParentLabel, kABBrotherLabel, kABSisterLabel, kABChildLabel, kABFriendLabel, kABSpouseLabel, kABPartnerLabel, kABAssistantLabel, kABManagerLabel, kABPhoneWorkLabel, kABPhoneHomeLabel, kABPhoneiPhoneLabel, kABPhoneMobileLabel, kABPhoneMainLabel, kABPhoneHomeFAXLabel, kABPhoneWorkFAXLabel, kABPhonePagerLabel, kABAIMWorkLabel, kABAIMHomeLabel, kABJabberWorkLabel, kABJabberHomeLabel, kABMSNWorkLabel, kABMSNHomeLabel, kABYahooWorkLabel, kABYahooHomeLabel, kABICQWorkLabel, kABICQHomeLabel, kABWorkLabel, kABHomeLabel, kABOtherLabel or kABMobileMeLabel.

Examples

Add a new URL to a contact:

```
Set Variable [ $r; MBS( "Addressbook.multivalue.New" ) ]
Set Variable [ $ID; MBS( "Addressbook.multivalue.addValue"; "http://www.mbsplugins.de"; "WorkLabel" ) ]
Set Variable [ $r; MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $ID ) ]
Set Variable [ $r; MBS( "Addressbook.record.SetValueForProperty"; $personID; "URLsProperty"; "multivalue" ) ]
```

Add work and home emails:

```
$r = MBS( "Addressbook.multivalue.New" )
$WorkEmailID = MBS( "Addressbook.multivalue.addValue"; Addressbook::WorkEmail; "EmailWorkLabel" )
$HomeEmailID = MBS( "Addressbook.multivalue.addValue"; Addressbook::HomeEmail; "EmailHomeLabel" )
```

```
$r = MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $WorkEmailID )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "multivalue" )
```

Add an address:

```
# Add one address
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.New"; 1 )
Set Variable [ $id; Value:MBS ( "Addressbook.multivalue.addAddress"; $str; $plz; $ort; $land; ""; "" ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.setPrimaryIdentifier"; $id ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "AddressProperty"; "multivalue" ) ]
```

Add an email:

```
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.New" )
Set Variable [ $id; Value:MBS ( "Addressbook.multivalue.addValue"; $email; "EmailWorkLabel" ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.setPrimaryIdentifier"; $id ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "multivalue" ) ]
```

Add phone numbers:

```
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.New" ) ]
Set Variable [ $tel_id; Value:MBS ( "Addressbook.multivalue.addValue"; $tel; "PhoneWorkLabel" ) ]
Set Variable [ $mob_id; Value:MBS ( "Addressbook.multivalue.addValue"; $mob; "PhoneMobileLabel" ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.multivalue.setPrimaryIdentifier"; $mob_id ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "PhoneProperty"; "multivalue" ) ]
```

Add homepage URLs:

```
# add homepages
Set Variable [ $r ; Value: MBS( "Addressbook.multivalue.New" ) ]
Set Variable [ $Blog_URL_ID ; Value: MBS( "Addressbook.multivalue.addValue"; "http://www.mbs-plugins.com/"; "Blog" ) ]
Set Variable [ $Homepage_URL_ID ; Value: MBS( "Addressbook.multivalue.addValue"; "http://www.monkeybreadsoftware.de/"; "HomePageLabel" ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $Homepage_URL_ID ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.record.SetValueForProperty"; $personID; "URLsProperty"; "multivalue" ) ]
```

33.37 Addressbook.multivalue.count

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.count")

Result Returns count.

Description

Examples

Query number of emails:

```
$personID = MBS( "Addressbook.me" )
$r = MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" )
$count = MBS( "Addressbook.multivalue.count")
```

Query all my URLs:

```
Set Variable [ $personID; Value:MBS( "Addressbook.me" ) ]
Set Variable [ $URLs; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "URLsProperty" ) ]
Set Variable [ $count; Value:MBS( "Addressbook.multivalue.count" ) ]
If [ $count >0 ]
# for loop
Set Variable [ $index; Value:0 ]
Loop
Set Variable [ $value; Value:MBS( "Addressbook.multivalue.valueAtIndex"; $index ) ]
Show Custom Dialog [ "URL"; $value ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $index = $count ]
End Loop
End If
```

33.38 Addressbook.multiple.identifierAtIndex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multiple.identifierAtIndex"; index)

Parameters**index**

The index of the identifier to be returned.

\$index

Result Returns the identifier or error.

Description

If the index argument is out of bounds, this method returns an error.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multiple.indexForIdentifier"; identifier)

Parameters

identifier

The identifier whose index will be returned.

\$identifier

Result Returns index or error.

Description

If the identifier is not found, returns MaxInt, a value >count from Addressbook.multiple.count.

33.42 Addressbook.multivalue.insertValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.insertValue"; value; label; index)

Parameters

value

The value to add.

\$value

label

The label to associate with the value.

\$label

index

The index where the value will be inserted.

\$index

Result Returns identifier or error.

Description

Returns the identifier of the inserted value and label if they are added successfully; otherwise, empty result. If either the value or the label is empty or if the index is out of bounds, this method returns an error.

Possible labels are:

kABHomePageLabel, kABEmailWorkLabel, kABEmailHomeLabel, kABAddressHomeLabel, kABAddressWorkLabel, kABAnniversaryLabel, kABFatherLabel, kABMotherLabel, kABParentLabel, kABBrotherLabel, kABSisterLabel, kABChildLabel, kABFriendLabel, kABSpouseLabel, kABPartnerLabel, kABAssistantLabel, kABManagerLabel, kABPhoneWorkLabel, kABPhoneHomeLabel, kABPhoneiPhoneLabel, kABPhoneMobileLabel, kABPhoneMainLabel, kABPhoneHomeFAXLabel, kABPhoneWorkFAXLabel, kABPhonePagerLabel, kABAIMWorkLabel, kABAIMHomeLabel, kABJabberWorkLabel, kABJabberHomeLabel, kABMSNWorkLabel, kABMSNHomeLabel, kABYahooWorkLabel, kABYahooHomeLabel, kABICQWorkLabel, kABICQHomeLabel, kABWorkLabel, kABHomeLabel, kABOtherLabel or kABMobileMeLabel.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.replaceLabelAtIndex"; index; label)

Parameters**index**

The index of the label that will be replaced.

\$index

label

The new label.

\$label

Result Returns OK on success and error on failure.

Description

If the label is empty or if the index is out of bounds, this method returns an error.

MBS("Addressbook.multivalue.replaceValueAtIndex"; index; value)

Parameters

index

The index of the value that will be replaced.

\$index

value

The new value.

\$value

Result Returns OK on success and error on failure.

Description

Examples

Replace an email:

```
# find my ID
Set Variable [ $personID; Value:MBS( "Addressbook.me" ) ]
# get email list
Set Variable [ $r; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" ) ]
# show first email in list
Set Variable [ $firstValue; Value:MBS( "Addressbook.multivalue.valueAtIndex"; 0 ) ]
Show Custom Dialog [ "First Email"; $firstValue ]
# replace first email with new email
Set Variable [ $r; Value:MBS( "Addressbook.multivalue.replaceValueAtIndex"; 0; "test@test.test" ) ]
# show changed email
Set Variable [ $firstValue; Value:MBS( "Addressbook.multivalue.valueAtIndex"; 0 ) ]
Show Custom Dialog [ "First Email"; $firstValue ]
# set back the email list
Set Variable [ $r; Value:MBS( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "" ) ]
# save it
Set Variable [ $r; Value:MBS( "Addressbook.save" ) ]
Show Custom Dialog [ "Saved"; $r ]
```

Replace an address:

```
# Find someone...
Set Variable [ $personID ; Value: MBS( "Addressbook.searchPeopleWithName"; "Jon"; "Test" ) ]
If [ Length($personID) >0 ]
# set Address
```

```

Set Variable [ $r ; Value: MBS( "Addressbook.record.valueForProperty"; $personID; "AddressProperty" ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.multivalued.replaceValueAtIndex"; 0; "Street=5th avenue$Zip=12345$Country=USA$City=New York" ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.record.SetValueForProperty"; $personID; "AddressProperty"; "multivalued" ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.save" ) ]
# get Address and show
Set Variable [ $r ; Value: MBS( "Addressbook.record.valueForProperty"; $personID; "AddressProperty" ) ]
Set Variable [ $Address ; Value: MBS( "Addressbook.multivalued.valueAtIndex"; 0 ) ]
Show Custom Dialog [ "Address" ; $Address ]
End If

```

33.49.1 Blog Entries

- [Store your ID in URLs in Mac address book](#)

Created 18th August 2014, last changed 9th December 2019.

33.50 Addressbook.multivalue.setPrimaryIdentifier

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	No

MBS("Addressbook.multivalue.setPrimaryIdentifier"; identifier)

Parameters

identifier

The identifier whose value will be used as the primary value for a multivalue property.

\$identifier

Result Returns OK on success and error on failure.

Description

If the identifier is empty, this method returns an error. Use the Addressbook.multivalue.identifierAtIndex method to get the identifier given the index.

Examples

Add a new URL to a contact:

```
Set Variable [ $r; MBS( "Addressbook.multivalue.New" ) ]
Set Variable [ $ID; MBS( "Addressbook.multivalue.addValue"; "http://www.mbsplugins.de"; "WorkLabel" ) ]
Set Variable [ $r; MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $ID ) ]
Set Variable [ $r; MBS( "Addressbook.record.SetValueForProperty"; $personID; "URLsProperty"; "multivalue" ) ]
```

Add work and home emails:

```
$r = MBS( "Addressbook.multivalue.New" )
$WorkEmailID = MBS( "Addressbook.multivalue.addValue"; Addressbook::WorkEmail; "EmailWorkLabel" )
$HomeEmailID = MBS( "Addressbook.multivalue.addValue"; Addressbook::HomeEmail; "EmailHomeLabel" )
$r = MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $WorkEmailID )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "multivalue" )
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.valueAtIndex"; index)

Parameters

index

The index for the value to be returned.

Result Returns value or error.

Description

If the index argument is out of bounds, this method returns an error.

Examples

Queries first email of me:

```
$personID = MBS( "Addressbook.me" )
$r = MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" )
$count = MBS( "Addressbook.multivalue.count" )
$email = MBS( "Addressbook.multivalue.valueAtIndex"; 0)
```

Query all my URLs:

```
Set Variable [ $personID; Value:MBS( "Addressbook.me" ) ]
Set Variable [ $URLs; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "URLsProperty" ) ]
Set Variable [ $count; Value:MBS( "Addressbook.multivalue.count" ) ]
If [ $count >0 ]
# for loop
Set Variable [ $index; Value:0 ]
Loop
Set Variable [ $value; Value:MBS( "Addressbook.multivalue.valueAtIndex"; $index ) ]
Show Custom Dialog [ "URL"; $value ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $index = $count ]
End Loop
End If
```

33.52 Addressbook.multiple.valueForIdentifier

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.multiple.valueForIdentifier"; identifier)

Parameters

identifier

The identifier you want to lookup the value for.

\$identifier

Result Returns value or error.

Description

If the identifier is not found, returns empty result.

Available in OS X v10.5 and later.

33.53 Addressbook.multivalue.valueForLabel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.valueForLabel"; label)

Parameters

label

The label to query.

\$label

Result Returns value or error.

Description

Examples

Shows different emails:

```
Set Variable [ $personID; Value:"637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson" ]
Set Variable [ $r; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" ) ]
Set Variable [ $w; Value:MBS( "Addressbook.multivalue.valueForLabel"; "EmailWorkLabel" ) ]
Set Variable [ $h; Value:MBS( "Addressbook.multivalue.valueForLabel"; "EmailHomeLabel" ) ]
Set Variable [ $o; Value:MBS( "Addressbook.multivalue.valueForLabel"; "OtherLabel" ) ]
Show Custom Dialog [ "Emails"; "Work email: " & $w & §& "Home email: " & $h & §& "Other email: " & $o ]
# there may be more than 3 labels!
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.1	Yes	No	No	No	Yes

MBS("Addressbook.multivalue.values")

Result Returns list or error.

Description

Examples

Shows emails for a record:

```
Set Variable [ $personID; Value:"637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson" ]
Set Variable [ $r; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" ) ]
Set Variable [ $r; Value:MBS( "Addressbook.multivalue.values" ) ]

33.55 Addressbook.people

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.people" { ; Account })

Parameters

Account

Optional

The account identifier to limit search for.

_local

Result Returns list of all person IDs.

Description

If the database doesn't contain any people, this method returns an empty array.

Examples

Get list of people IDs and show name of first person:

```
Set Variable [ $people; Value:MBS( "Addressbook.people" ) ]
```

```
Set Variable [ $firstPerson; Value:GetValue($people; 1) ]
```

```
Show Custom Dialog [ "Name of first person"; MBS( "Addressbook.record.displayname"; $firstPerson ) ]

33.56 Addressbook.persistentAccounts

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.2	Yes	No	No	No	No

MBS("Addressbook.persistentAccounts")

Result Returns list or error.

Description

Examples

Show persistent accounts:

```
Set Variable [ $accounts; Value:MBS( "Addressbook.persistentAccounts" ) ]
Set Variable [ $count; Value:ValueCount($accounts) ]
Set Variable [ $index; Value:1 ]
Loop
Set Variable [ $account; Value:GetValue($accounts; $index) ]
Show Custom Dialog [ "Identifier: " & $account & $&
"Name: " & MBS( "Addressbook.Account.Name"; $account) & $&
"Type: " & MBS( "Addressbook.Account.Type"; $account) & $&
"Main: " & MBS( "Addressbook.Account.isMainAccount"; $account) & $&

33.57 Addressbook.person.EditInAddressbook

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	No

MBS("Addressbook.person.EditInAddressbook"; PersonID)

Parameters**PersonID**

The unique ID for the target person.

\$personID

Result Returns OK on success or error on failure.

Description**Examples**

Show owner in addressbook:

MBS("Addressbook.person.ShowInAddressbook"; MBS("Addressbook.me"))

Edit owner in addressbook:

MBS("Addressbook.person.EditInAddressbook"; MBS("Addressbook.me"))

33.58 Addressbook.person.ExternalUID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.1	Yes	No	No	No	Yes

MBS("Addressbook.person.ExternalUID"; PersonID)

Parameters

PersonID

The unique ID for the target person.

\$personID

Result Returns text or error.

Description

As given by CardDAV server for example.

Examples

Find external UID:

MBS("Addressbook.person.ExternalUID"; "637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson")

33.59 Addressbook.person.GetImage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.person.GetImage"; PersonID { ; ImageType; Filename })

Parameters

PersonID

The unique ID for the target person.

\$personID

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Result Returns an image as container value or error.

Description

Examples

Get my image into container field:

```
Set Variable [ $myID; Value:MBS( "Addressbook.me" ) ]
Set Variable [ $image; Value:MBS( "Addressbook.person.GetImage"; $myID) ]
Set Field [ Test::Image; $image ]
```

33.60 Addressbook.person.SetBirthdayComponents

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	5.4	Yes	No	No	No	Yes

MBS("Addressbook.person.SetBirthdayComponents"; PersonID; Year; Month; Day)

Parameters

PersonID

The unique ID for the target person.

\$personID

Year

The year. Can be empty for no year.

1981

Month

The month. Can be empty for no month.

12

Day

The day. Can be empty for no day.

1

Result Returns OK or error.

Description

This allows to set a birthday without knowing the year.

Require OS X 10.7 or newer.

Examples

Set birthday to 6th May:

```
MBS( "Addressbook.person.SetBirthdayComponents"; $personID; ""; 5; 6)
```

33.65 Addressbook.person.vCardRepresentation

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.person.vCardRepresentation"; PersonID { ; Filename; asText })

Parameters

PersonID

The unique ID for the target person.

\$personID

Filename

Optional

The file name for the container value with the vcard. Default is "person.vcf".

\$name & ".vcf"

asText

Optional

Pass 1 to get back result as text instead of container.

1

Result Returns vcard file data.

Description

You can store this in a container and export to a file or email.

33.68 Addressbook.record.SetValueForProperty

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.record.SetValueForProperty"; RecordID; PropertyName; Value)

Parameters

RecordID

The unique ID for the target person or group.

\$personID

PropertyName

The name of the property.

"EmailProperty"

Value

The value as text, date or number.

\$value

Result Returns OK on success and error on failure.

Description

For multivalue items, please use an empty string as value and the plugin will put in the current multivalue. Possible property names are UIDProperty, CreationDateProperty, ModificationDateProperty, FirstNameProperty, LastNameProperty, FirstNamePhoneticProperty, LastNamePhoneticProperty, NicknameProperty, MaidenNameProperty, BirthdayProperty, BirthdayComponentsProperty, OrganizationProperty, JobTitleProperty, HomePageProperty, URLsProperty, CalendarURIsProperty, EmailProperty, AddressProperty, OtherDatesProperty, OtherDateComponentsProperty, RelatedNamesProperty, DepartmentProperty, PhoneProperty, AIMInstantProperty, JabberInstantProperty, MSNInstantProperty, YahooInstantProperty, ICQInstantProperty, InstantMessageProperty, SocialProfileProperty, NoteProperty, MiddleNameProperty, MiddleNamePhoneticProperty, TitleProperty, SuffixProperty and GroupNameProperty.

Examples

Set first name on a person:

```
MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; Addressbook::FirstName )
```

Add a new URL to a contact:

```
Set Variable [ $r; MBS( "Addressbook.multivalue.New" ) ]
Set Variable [ $ID; MBS( "Addressbook.multivalue.addValue"; "http://www.mbsplugins.de"; "WorkLabel" ) ]
Set Variable [ $r; MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $ID ) ]
Set Variable [ $r; MBS( "Addressbook.record.SetValueForProperty"; $personID; "URLsProperty"; "multivalue" ) ]
```

Add work and home emails:

```
$r = MBS( "Addressbook.multivalue.New" )
$WorkEmailID = MBS( "Addressbook.multivalue.addValue"; Addressbook::WorkEmail; "EmailWorkLabel"
)
$HomeEmailID = MBS( "Addressbook.multivalue.addValue"; Addressbook::HomeEmail; "EmailHomeLabel" )
$r = MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $WorkEmailID )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; "multivalue" )
```

Set flags, so entry shows as company:

```
MBS( "Addressbook.record.SetValueForProperty"; $personID; "PersonFlags"; 1 )
```

Edit existing person:

```
# get an UUID for a person record
$personID = "637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson"
# set a new name
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; "John" )
# save it
$r = MBS( "Addressbook.save" )
```

Replace an email:

```
# find my ID
Set Variable [ $personID; Value:MBS( "Addressbook.me" ) ]
# get email list
Set Variable [ $r; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" ) ]
# show first email in list
Set Variable [ $firstValue; Value:MBS( "Addressbook.multivalue.valueAtIndex"; 0 ) ]
Show Custom Dialog [ "First Email"; $firstValue ]
# replace first email with new email
Set Variable [ $r; Value:MBS( "Addressbook.multivalue.replaceValueAtIndex"; 0; "test@test.test" ) ]
# show changed email
Set Variable [ $firstValue; Value:MBS( "Addressbook.multivalue.valueAtIndex"; 0 ) ]
Show Custom Dialog [ "First Email"; $firstValue ]
# set back the email list
Set Variable [ $r; Value:MBS( "Addressbook.record.SetValueForProperty"; $personID; "EmailProperty"; ""
) ]
# save it
Set Variable [ $r; Value:MBS( "Addressbook.save" ) ]
Show Custom Dialog [ "Saved"; $r ]
```

Add first and last name:

```
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "FirstName-
```

```
Property"; $vn ) ]
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "LastName-Property"; $nn ) ]
```

Set organization:

```
Set Variable [ $result; Value:MBS ( "Addressbook.record.SetValueForProperty"; $personID; "Organization-Property"; $org ) ]
```

Add homepage URLs:

```
# add homepages
Set Variable [ $r ; Value: MBS( "Addressbook.multivalue.New" ) ]
Set Variable [ $Blog_URL_ID ; Value: MBS( "Addressbook.multivalue.addValue"; "http://www.mbs-plugins.com/"; "Blog" ) ]
Set Variable [ $Homepage_URL_ID ; Value: MBS( "Addressbook.multivalue.addValue"; "http://www.monkeybreadsoftware.de/"; "HomePageLabel" ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.multivalue.setPrimaryIdentifier"; $Homepage_URL_ID ) ]
Set Variable [ $r ; Value: MBS( "Addressbook.record.SetValueForProperty"; $personID; "URLsProperty"; "multivalue" ) ]
```

33.69 Addressbook.record.UniqueID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.record.UniqueID"; RecordID)

Parameters

RecordID

The unique ID for the target person or group.

\$personID

Result Returns the unique ID for a record.

Description

Use this method to query the record ID for a new person or group after you saved it.

Examples

Create person and save changes:

```
$personID = MBS( "Addressbook.NewPerson" )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; "John" )
$r = MBS( "Addressbook.addRecord"; $personID )
$r = MBS( "Addressbook.save" )
# Learn real ID for new record
$personID = MBS( "Addressbook.record.UniqueID"; $personID )
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.record.displayname"; RecordID)

Parameters

RecordID

The unique ID for the target person or group.

\$personID

Result Returns name or error.

Description

Returns firstname & lastname for persons, organization name for organizations and group name for groups.

Examples

Query display name of first group:

```
MBS( "Addressbook.record.displayname"; ElementLeft ( MBS( "Addressbook.groups" ) ; 1 ) )
```

Query display name of addressbook's owner:

```
MBS( "Addressbook.record.displayname"; MBS( "Addressbook.me" ) )
```

Query display name based on a ID:

```
MBS( "Addressbook.record.displayname"; "CFD73A44-24DD-480F-A1DE-A31926BC4AC7:ABPerson" )
```

MBS("Addressbook.record.valueForProperty"; RecordID; PropertyName)

Parameters

RecordID

The unique ID for the target person or group.

\$personID

PropertyName

The name of the property to query.

"EmailProperty"

Result Returns the value of a given property for a record.

Description

Possible property names are UIDProperty, CreationDateProperty, ModificationDateProperty, FirstNameProperty, LastNameProperty, FirstNamePhoneticProperty, LastNamePhoneticProperty, NicknameProperty, MaidenNameProperty, BirthdayProperty, BirthdayComponentsProperty, OrganizationProperty, JobTitleProperty, HomePageProperty, URLsProperty, CalendarURIsProperty, EmailProperty, AddressProperty, OtherDatesProperty, OtherDateComponentsProperty, RelatedNamesProperty, DepartmentProperty, PhoneProperty, AIMInstantProperty, JabberInstantProperty, MSNInstantProperty, YahooInstantProperty, ICQInstantProperty, InstantMessageProperty, SocialProfileProperty, NoteProperty, MiddleNameProperty, MiddleNamePhoneticProperty, TitleProperty, SuffixProperty and GroupNameProperty.

Examples

Query first name of a person:

```
MBS( "Addressbook.record.valueForProperty"; $personID; "FirstNameProperty" )
```

Query group name of a group:

```
MBS( "Addressbook.record.valueForProperty"; "57956420-03A4-4C09-8219-6874B897D25F:ABGroup"; "GroupName" )
```

Query my ID:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "UIDProperty" )
```

Query creation date of my record:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "CreationDateProperty" )
```

Query birthday of my record:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "BirthdayProperty" )
```

Query birthday components for my record:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "BirthdayComponentsProperty" )
```

Query my company name:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "OrganizationProperty" )
```

Query my job title:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "JobTitleProperty" )
```

Query my department:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "DepartmentProperty" )
```

Query my note:

```
MBS( "Addressbook.record.valueForProperty"; MBS( "Addressbook.me" ); "NoteProperty" )
```

Query all my URLs:

```
Set Variable [ $personID; Value:MBS( "Addressbook.me" ) ]
Set Variable [ $Urls; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "URLsProperty" ) ]
Set Variable [ $count; Value:MBS( "Addressbook.multivalue.count" ) ]
If [ $count >0 ]
# for loop
Set Variable [ $index; Value:0 ]
Loop
Set Variable [ $value; Value:MBS( "Addressbook.multivalue.valueAtIndex"; $index ) ]
Show Custom Dialog [ "URL"; $value ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $index = $count ]
End Loop
End If
```

Shows different emails:

```
Set Variable [ $personID; Value:"637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson" ]
Set Variable [ $r; Value:MBS( "Addressbook.record.valueForProperty"; $personID; "EmailProperty" ) ]
Set Variable [ $w; Value:MBS( "Addressbook.multivalue.valueForLabel"; "EmailWorkLabel" ) ]
Set Variable [ $h; Value:MBS( "Addressbook.multivalue.valueForLabel"; "EmailHomeLabel" ) ]
```

```
Set Variable [ $o; Value:MBS( "Addressbook.multivalue.valueForLabel"; "OtherLabel" ) ]
Show Custom Dialog [ "Emails"; "Work email: " & $w & $& "Home email: " & $h & $& "Other email: "
& $o ]
# there may be more than 3 labels!
```

Show note of an user:

```
MBS( "Addressbook.record.valueForProperty"; "637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson";
"NoteProperty" )
```

Query an address:

```
# Find someone...
Set Variable [ $personID ; Value: MBS( "Addressbook.searchPeopleWithName"; "Jon"; "Test" ) ]
If [ Length($personID) >0 ]
# get Address
Set Variable [ $r ; Value: MBS( "Addressbook.record.valueForProperty"; $personID; "AddressProperty" ) ]
Set Variable [ $Address ; Value: MBS( "Addressbook.multivalue.valueAtIndex"; 0) ]
Show Custom Dialog [ "Address" ; $Address ]
End If
```

Example result: Street=Some street. 123

Zip=12345

Country=Deutschland

City=Test

33.74 Addressbook.recordsMatchingSearchElement

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	5.4	Yes	No	No	No	No

MBS("Addressbook.recordsMatchingSearchElement"; SearchElement)

Parameters

SearchElement

The ID for the search element.

\$SearchElement

Result Returns list or error.

Description

Returns a list of records that match the given search element, or returns an empty array if no records match the search element.

Examples

Find a person with first name being Christian:

```
Set Variable [ $e1; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "FirstNameProperty";
""; ""; "Christian"; "Equal" ) ]
Set Variable [ $records; Value:MBS( "Addressbook.recordsMatchingSearchElement"; $e1 ) ]
Set Variable [ $record; Value:GetValue($records; 1) ]
Set Variable [ $name; Value:MBS( "Addressbook.record.displayname"; $record ) ]
Show Custom Dialog [ $name ]
```

Search people with related name being John:

```
Set Variable [ $e1; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "RelatedNamesProp-
erty"; ""; ""; "John"; "ContainsSubStringCaseInsensitive" ) ]
Set Variable [ $records; Value:MBS( "Addressbook.recordsMatchingSearchElement"; $e1 ) ]
Set Variable [ $record; Value:GetValue($records; 1) ]
Set Variable [ $name; Value:MBS( "Addressbook.record.displayname"; $record ) ]
Show Custom Dialog [ $name ]
```

Created 18th August 2014, last changed 24th September 2019.

33.76 Addressbook.save

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

```
MBS( "Addressbook.save" )
```

Result Returns OK on success and error on failure.

Description

Examples

Create person and save changes:

```
$personID = MBS( "Addressbook.NewPerson" )
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; "John" )
$r = MBS( "Addressbook.addRecord"; $personID )
$r = MBS( "Addressbook.save" )
```

Edit existing person:

```
# get an UUID for a person record
$personID = "637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson"
# set a new name
$r = MBS( "Addressbook.record.SetValueForProperty"; $personID; "FirstNameProperty"; "John" )
# save it
$r = MBS( "Addressbook.save" )
```

Add a new person to addressbook.

```
# Fields to variables
#
Set Variable [ $vn; Value:Adressen::Extra ]
Set Variable [ $nn; Value:Adressen::Nachname ]
Set Variable [ $org; Value:Adressen::Name ]
Set Variable [ $str; Value:Adressen::Straße ]
Set Variable [ $land; Value:Adressen::Land ]

33.77 Addressbook.searchElementForConjunction

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	5.4	Yes	No	No	No	No

MBS("Addressbook.searchElementForConjunction"; conjunction; SearchElements)

Parameters

conjunction

The logical operator with which to combine the search elements. Can be "AND" or "OR".
"AND"

SearchElements

List of search element IDs.

Result Returns ID or error.

Description

Returns a compound search element, created by combining the search elements in an array with the given conjunction.

Examples

Find people with last name and email matching:

```
Set Variable [ $e1; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "LastNameProperty";
""; ""; "Schmitz"; "ContainsSubStringCaseInsensitive" ) ]
Set Variable [ $e2; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "EmailProperty"; "";
""; "monkeybread"; "ContainsSubStringCaseInsensitive" ) ]
Set Variable [ $e; Value:MBS( "Addressbook.searchElementForConjunction"; "and"; $e1 & $e2 ) ]
Set Variable [ $records; Value:MBS( "Addressbook.recordsMatchingSearchElement"; $e ) ]
Set Variable [ $record; Value:GetValue($records; 1) ]
Set Variable [ $name; Value:MBS( "Addressbook.record.displayname"; $record ) ]
Show Custom Dialog [ $name ]
```

33.78 Addressbook.searchElementForProperty

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	5.4	Yes	No	No	No	No

MBS("Addressbook.searchElementForProperty"; Type; Property; Label; Key; Value; Comparison)

Parameters

Type

Whether to make search element for group or person. Can be "Group" or "Person".
"Person"

Property

The name of the property to search on, such as ABAddressProperty or ABLastNameProperty.
"LastNameProperty"

Label

The label name for a multivalue list, such as kABAddressHomeLabel, kABPhoneWorkLabel, or a user-specified label, such as Summer Home. If the specified property does not have multiple values, pass "". If the specified property does have multiple values, pass "" to search all the values.

Key

The key name for a dictionary, such as kABAddressCityKey or kABAddressStreetKey. If the specified property is not a dictionary, pass "". If the specified property is a dictionary, pass "" to search all keys.

Value

What you're searching for. If empty, then the only supported value for comparison is ABEqual or ABNotEqual.

Comparison

The comparison operator. Can be Equal, NotEqual, LessThan, LessThanOrEqual, GreaterThan, GreaterThanOrEqual, EqualCaseInsensitive, ContainsSubString, ContainsSubStringCaseInsensitive, PrefixMatch, PrefixMatchCaseInsensitive, BitsInBitFieldMatch, DoesNotContainSubString, DoesNotContainSubStringCaseInsensitive, NotEqualCaseInsensitive, SuffixMatch, SuffixMatchCaseInsensitive, WithinIntervalAroundToday, WithinIntervalAroundTodayYearless, NotWithinIntervalAroundToday, NotWithinIntervalAroundTodayYearless, WithinIntervalFromToday, WithinIntervalFromTodayYearless, NotWithinIntervalFromToday or NotWithinIntervalFromTodayYearless.
"Equal"

Result Returns ID or error.

Description

Returns a search element object that specifies a query for records of this type.

Possible property names are UIDProperty, CreationDateProperty, ModificationDateProperty, FirstNameProperty, LastNameProperty, FirstNamePhoneticProperty, LastNamePhoneticProperty, NicknameProperty, MaidenNameProperty, BirthdayProperty, BirthdayComponentsProperty, OrganizationProperty, JobTitleProperty, HomePageProperty, URLsProperty, CalendarURIsProperty, EmailProperty, AddressProperty, OtherDatesProperty, OtherDateComponentsProperty, RelatedNamesProperty, DepartmentProperty, PhoneProp-

erty, AIMInstantProperty, JabberInstantProperty, MSNInstantProperty, YahooInstantProperty, ICQInstantProperty, InstantMessageProperty, SocialProfileProperty, NoteProperty, MiddleNameProperty, MiddleNamePhoneticProperty, TitleProperty, SuffixProperty and GroupNameProperty.

Examples

Find a person with first name being Christian:

```
Set Variable [ $e1; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "FirstNameProperty";
""; ""; "Christian"; "Equal" ) ]
Set Variable [ $records; Value:MBS( "Addressbook.recordsMatchingSearchElement"; $e1 ) ]
Set Variable [ $record; Value:GetValue($records; 1) ]
Set Variable [ $name; Value:MBS( "Addressbook.record.displayname"; $record ) ]
Show Custom Dialog [ $name ]
```

Search people with related name being John:

```
Set Variable [ $e1; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "RelatedNamesProp-
erty"; ""; ""; "John"; "ContainsSubStringCaseInsensitive" ) ]
Set Variable [ $records; Value:MBS( "Addressbook.recordsMatchingSearchElement"; $e1 ) ]
Set Variable [ $record; Value:GetValue($records; 1) ]
Set Variable [ $name; Value:MBS( "Addressbook.record.displayname"; $record ) ]
Show Custom Dialog [ $name ]
```

Find all companies:

```
# Companies have PersonFlags = 1 while normal people have 0.
Set Variable [ $e; Value:MBS( "Addressbook.searchElementForProperty"; "person"; "PersonFlags"; ""; "";
1; "Equal" ) ]
Set Variable [ $records; Value:MBS( "Addressbook.recordsMatchingSearchElement"; $e ) ]
Set Variable [ $record; Value:GetValue($records; 1) ]
Set Variable [ $name; Value:MBS( "Addressbook.record.displayname"; $record ) ]
Show Custom Dialog [ $name ]
```

33.80 Addressbook.searchPeopleWithCreationDate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.5	Yes	No	No	No	No

MBS("Addressbook.searchPeopleWithCreationDate"; StartDate { ; EndDate })

Parameters**StartDate**

The start date for the search range.

Date(10; 1; 2013)

EndDate

Optional

The end date for the search range.

Date(11; 1; 2013)

Result Returns list of all person IDs.

Description**Examples**

Searches all people created between 1st of September and 1st of December 2013:

MBS("Addressbook.searchPeopleWithCreationDate"; Date (9 ; 1 ; 2013); Date (10 ; 1 ; 2013))

Searches all people created after 1st of September:

MBS("Addressbook.searchPeopleWithModificationDate"; Date (9 ; 1 ; 2013))

33.84 Addressbook.searchPersonWithExternalUID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	6.1	Yes	No	No	No	No

MBS("Addressbook.searchPersonWithExternalUID"; UID)

Parameters

UID

The external UID. Not the unique ID we use elsewhere for person.
"cfd73a44-24dd-480f-a1de-a31926bc4ac1"

Result Returns person ID or error.

Description

The plugin has to look into each person, find the external ID and compare it.
So this call can take a while.

Examples

Find unique ID for record based on external ID:

MBS("Addressbook.searchPersonWithExternalUID"; "637fa922-7a2b-4f9a-bfa3-023253d4a3d5")

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
33 Addressbook	3.1	Yes	No	No	No	Yes

MBS("Addressbook.setMe"; PersonID)

Parameters

PersonID

The unique ID for the target person.

\$personID

Result Returns OK on success and error on failure.

Description

If you don't want a record to represent the logged-in user, then pass empty string as the person argument. Note that this will not delete the existing record, if one is set.

34.6 App.GetDockIcon

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	3.2	Yes	No	Yes, macOS only	No	No

MBS("App.GetDockIcon" { ; ImageType; Filename })

Parameters

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Result Returns image or error.

Description

Only queries a dock item image you set before with App.SetDockIcon

Returns nothing if no image was set.

34.7 App.GetProcessName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	3.2	Yes	Yes	Yes	Yes	Yes

MBS("App.GetProcessName")

Result Returns name or error.

Description

This value does not change by App.SetProcessName as it queries the true name. For FileMaker Pro, this is "FileMaker Pro", even if you have Advanced version.

See also

34.8 App.GetProcessPath

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	3.5	Yes	Yes	Yes	Yes	Yes

MBS("App.GetProcessPath")

Result Returns path or error.

Description

This value does not change by App.SetProcessName as it queries the file path.

Examples

Get app folder path:

```
MBS( "Path.RemoveLastPathComponent"; MBS( "App.GetProcessPath" ) )
```

34.9 App.MemoryUsed

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	6.5	Yes	Yes	Yes	No	No

MBS("App.MemoryUsed")

Result Returns number or error.

Description

This is to query the memory used in bytes for the current application.

On Server this would query the scripting process.

The value returned is not exactly the same as in Task Manager or Activity Monitor as this includes some shared memory for your process, which those don't count per app.

See also App.CompactMemory for Windows to reduce memory.

Examples

Query memory used

```
Round(MBS("App.MemoryUsed") / 1024 / 1024; 0) & " MB"
```

See also

- [34.3 App.CompactMemory](#) 911

34.10 App.OpenFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	7.4	Yes	No	No	No	No

MBS("App.OpenFile"; path)

Parameters

path

The native file path to the file to open.

"/Users/cs/Desktop/test.fmp12"

Result Returns OK or error.

Description

This happens asynchronously, so we have no idea if it works or not.

FileMaker may show error dialogs.

This call must be last in a script as you can't open a file while a script is running, the file should open when the script is done. You can use FM.RunScriptLater to run a script in a few seconds to follow up. There you can check with window functions and see if there is a new window in front.

See also Files.Launch and Files.LaunchFile.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

Examples

Open a database:

```
Set Variable [ $r ; Value: MBS("App.OpenFile"; "/Users/cs/Desktop/test.fmp12") ]
```

34.11 App.ProcessID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	8.0	Yes	Yes	Yes	Yes	Yes

MBS("App.ProcessID")

Result Returns process ID or error.

Description

If it changes while your server runs, that means the scripting process crashed in-between.

34.11.1 Blog Entries

- [MBS FileMaker Plugin, version 7.6pr2](#)

Created 10th December 2017, last changed 10th December 2017.

34.12 App.RequestUserAttention

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	6.1	Yes	No	No	No	No

MBS("App.RequestUserAttention" { ; Critical })

Parameters

Critical

Optional

Pass 1 if critical or 0 if informative.

0

Result Returns number or error.

Description

Returns the identifier for the request. You can use this value to cancel the request later using the `App.CancelUserAttentionRequest` method.

Activating the app cancels the user attention request. A spoken notification will occur if spoken notifications are enabled. Sending `App.RequestUserAttention` to an app that is already active has no effect.

If the inactive app presents a modal panel, this method will be invoked with `critical = 1` automatically. The modal panel is not brought to the front for an inactive app.

This method is a way to have the dock icon jumping.

Examples

Request attention:

```
Set Variable [ $r; Value:MBS( "App.RequestUserAttention"; 1 ) ]
```

See also

34.13 App.SetDockBadgeLabel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	2.6	Yes	No	No	No	Yes

MBS("App.SetDockBadgeLabel"; text)

(old name: AppDockTile.setBadgeLabel)

Parameters

text

The localized string to display. This string can contain a count value or other badging information. To clear the badge string, specify an empty string "".

"123"

Result Returns OK on success.

Description

The appearance of the badge area is system defined.
Available in Mac OS X v10.5 and later.

iOS added in 7.2, but the badge is a number.

Examples

Set and query dock badge:

```
Set Variable [ $r; Value:MBS( "App.SetDockBadgeLabel"; "123" ) ]
Show Custom Dialog [ MBS( "App.GetDockBadgeLabel" ) ]
```

34.14 App.SetDockIcon

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	3.2	Yes	No	Yes, macOS only	No	No

MBS("App.SetDockIcon"; Image)

Parameters

Image

The image to use. Pass a container value with JPEG, TIFF, PNG or other image formats.
\$image

Result Returns OK or error.

Description

Works with FileMaker Pro and runtimes.

34.15 App.SetProcessName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
34 App	3.2	Yes	No	Yes, macOS only	No	No

MBS("App.SetProcessName"; name)

Parameters

name

The new name to display.

"MyApp"

Result Returns OK or error.

Description

So for a runtime or FileMaker itself, this changes the name in the menubar.

Chapter 35

AppleScript

Run Apple Scripts.

The script source can be calculated. Precompile a script to run it several times with better performance. Between runs you can use properties in AppleScript to exchange values.

35.1 AppleScript.Close

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	1.0	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.Close"; Script ID)

Parameters

Script ID

The ID returned by the "Applescript.Compile" function.

1

Result Returns "OK" or an error message.

Description

Not really necessary since scripts don't take much space.

Examples

Remove A compiled Script from memory

MBS("Applescript.Close" ; \$scriptID)

See also

- 35.2 AppleScript.Compile

927

- 35.4 AppleScript.GetPropertyNames 929
- 35.8 AppleScript.PropertyCount 934
- 35.9 AppleScript.Run 935

Created 18th August 2014, last changed 31st October 2016.

35.2 AppleScript.Compile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	1.0	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.Compile"; Script Text)

Parameters

Script Text

This is the text of the script to compile
"3 + 4"

Result Returns ScriptID or error.

Description

You can use the Script ID to run the script using the Applescript.Execute function. The compiled script is stored in memory. This is useful if you have large script that needs to be run over and over again.

Examples

Compile a script

MBS("Applescript.Compile" ; \$Applescript)

See also

- 35.1 AppleScript.Close 925
- 35.3 AppleScript.Execute 928
- 35.4 AppleScript.GetPropertyname 929

- 35.8 AppleScript.PropertyCount 934
- 35.9 AppleScript.Run 935
- 35.10 AppleScript.SetPropertyvalue 940

Created 18th August 2014, last changed 31st October 2016.

35.3 AppleScript.Execute

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	1.0	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.Execute"; Script ID)

Parameters

Script ID

The Id of the script you want to execute. This ID returned by the Applescript.Compile function.

1

Description

AppleScripts can return a result to the object that called them. This is similar to the Script Results that were introduced in FileMaker 8.0.

Older plugin versions used to put quotes around result. 6.4 and newer don't include quotes.

Examples

Execute a stored Applescript

MBS("Applescript.Execute" ; \$ScriptID)

See also

- 35.2 AppleScript.Compile 927
- 35.9 AppleScript.Run 935

Created 18th August 2014, last changed 31st October 2016.

35.4 AppleScript.GetPropertyNames

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	4.2	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.GetPropertyNames"; Script ID; Index)

Parameters

Script ID

The ID of the script you want to execute. This ID returned by the Applescript.Compile function.

1

Index

The index of the property from 0 to Applescript.PropertyCount-1.

0

Result Returns name or error.

Description

Lasterror is set.

Examples

List properties by name:

```
Set Variable [ $scriptId; Value:MBS( "Applescript.Compile"; AppleScript Properties::AppleScriptCode ) ]
If [ MBS("isError") ]
Show Custom Dialog [ Message: MBS("AppleScript.LastErrorMessage"); Buttons: "OK", "Cancel" ]
Exit Script [ ]
End If
Set Variable [ $count; Value:MBS( "Applescript.PropertyCount"; $scriptId) ]
Set Variable [ $list; Value:"" ]
Set Variable [ $i; Value:0 ]
If [ GetAsNumber($count) >0 ]
Loop
Set Variable [ $n; Value:MBS( "Applescript.GetPropertyNames"; $scriptId; $i ) ]
Set Variable [ $list; Value:$list & $n & $]
Set Variable [ $i; Value:$i+1 ]
Exit Loop If [ $count = $i ]
End Loop
Show Custom Dialog [ Title: $count & " Properties"; Message: $list; Buttons: "OK", "Cancel" ]
End If
Set Variable [ $r; Value:MBS( "Applescript.Close"; $scriptId) ]
```

Created 18th August 2014, last changed 31st October 2016.

35.5 AppleScript.GetPropertyValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	4.2	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.GetPropertyValue"; Script ID; Name)

Parameters

Script ID

The Id of the script you want to execute. This ID returned by the Applescript.Compile function.

1

Name

The name of the property.

"MyValue"

Result Returns value or error.

Description

Lasterror is set.

Examples

Query a property:

Show Custom Dialog [MBS("Applescript.GetPropertyValue"; \$scriptID; "MySubject")]

See also

35.6 AppleScript.LastError

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	1.0	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.LastError")

Description

Any AppleScript Errors that are not trapped using "try" blocks, will abort the AppleScript. Also returns AppleScript compile errors. This function is useful for error trapping your scripts.

Examples

Get Last Error

MBS("Applescript.LastError")

See also

- 35.4 AppleScript.GetPropertyNames 929
- 35.7 AppleScript.LastErrorMessage 933

Created 18th August 2014, last changed 31st October 2016.

35.7 AppleScript.LastErrorMessage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	1.0	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.LastErrorMessage")

Description

Any AppleScript Errors that are not trapped using "try" blocks, will abort the AppleScript. AppleScript Compile errors are also reported here. This function is useful for error trapping your scripts.

Examples

Get the Last Applescript Error as text

```
MBS( "Applescript.LastErrorMessage")
```

See also

Created 18th August 2014, last changed 31st October 2016.

35.8 AppleScript.PropertyCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	4.2	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.PropertyCount"; Script ID)

Parameters

Script ID

The Id of the script you want to execute. This ID returned by the Applescript.Compile function.

1

Result Returns number or error.

Description

Lasterror is set.

Examples

Compiles code and query property count:

```
Set Variable [ $scriptID; Value:MBS( "Applescript.Compile"; AppleScript Properties::AppleScriptCode ) ]
Set Variable [ $count; Value:MBS( "Applescript.PropertyCount"; $scriptID) ]
Set Variable [ $r; Value:MBS( "Applescript.Close"; $scriptID) ]
```

Created 18th August 2014, last changed 31st October 2016.

35.9 AppleScript.Run

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	1.0	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.Run"; Script Text)

Parameters

Script Text

This is the text of the script to run

"3 + 4"

Description

Any Result returned by the AppleScript is returned as the result of the calculation. This is similar to the Script Results that were introduced in FileMaker 8.0. This is much easier then using Applescript.Compile, Applescript.Execute and Applescript.Close

Older plugin versions used to put quotes around result. 6.4 and newer don't include quotes.

Examples

Trigger a FileMaker Script Using OS Scripting

```
Let(
[
// — the name of the script to run —————

ScriptName = "Triggered Script";
FileName = Get(FileName);

//—————

//— don't need to edit anything below this line ——

Applescript = "do script " & Quote(ScriptName);

VBScriptText =
"FUNCTION DoFMSCript(FileName, ScriptName)" & "§" &
"Set fmApp = CreateObject(\"FMPro.Application\")" & "§" &
"fmApp.Visible = True" & "§" &
"Set fmDocs = fmApp.Documents" & "§" &
"For Each fmDoc In fmDocs" & "§" &
"If InStr(LCase(fmDoc.fullname), LCase(FileName)) >0 Then" & "§" &
" fmDoc.dofmscript (ScriptName)" & "§" &
"End If" & "§" &
"Next" & "§" &
```

```

"END FUNCTION";

ScriptID = MBS("WindowsScript.Create");
lang= MBS("WindowsScript.SetLanguage"; ScriptID; "VBScript");
addcode = MBS("WindowsScript.AddCode"; ScriptID; VBScriptText)

];
Case(
Get ( SystemPlatform ) = 1;

// Mac OSX Case
MBS(
"Applescript.Run";
Applescript
);

// Windows Case
MBS("WindowsScript.ExecuteFunction";ScriptID; "DoFMScript";FileName; ScriptName) &
MBS("WindowsScript.Close"; ScriptID)

)
)

Create A Folder

Let(
[
/*-----PARAMETERS-----*/
folderName = "My New Folder";

scriptText =
"set folder_name to " & Quote(folderName) & "§" &
"tell application " & Quote("Finder") & "§" &
" set f to make new folder at desktop" & "§" &
" set the name of f to folder_name" & "§" &
"end tell"

];
/*-----FUNCTION-----*/
MBS(
"Applescript.Run";
scriptText
)
)

/*-----/

```

Creates a folder called "My New Folder on the users desktop
/

Get Names From Address Book

```
Let(
[
/*-----PARAMETERS-----*/
scriptText =
"tell application \"Address Book\" & \"§\" &
" set the_list to \"\" & \"§\" &
" set person_list to the name of every person\" & \"§\" &
" repeat with this_name in person_list\" & \"§\" &
" set the_list to the_list & this_name & return\" & \"§\" &
" end repeat\" & \"§\" &
"end tell"
```

```
];
/*-----FUNCTION-----*/
MBS(
"Applescript.Run";
scriptText
)
)
```

```
/*-----/
Creates a folder called "My New Folder on the users desktop
/
```

Trigger A FileMaker Script (Custom Function)

```
MBS_TriggerScript ( "Triggered Script" ; Get ( FileName ) )
```

Custom Function Definition

```
/*#####
#####
#####
```

```
MBS_TriggerScript
created 10/26/06, by Todd Geist, todd@geistinteractive.com
```

Parameters: theScriptName, theFileName

Dependencies: MBS FileMaker Plug-in.

Notes: Uses VBScript and Applescript to run a script

Speak using AppleScript:

```
Set Variable [ $text ; Value: "Hello \"Test\"" ]  
Set Variable [ $voice ; Value: "Daniel" ]  
Set Variable [ $rate ; Value: 100 ]  
Set Variable [ $pitch ; Value: 60 ]
```

```
Set Variable [ $text ; Value: Substitute($text; "\"" ; "\\\"") ]  
Set Variable [ $r ; Value: MBS( "AppleScript.Run"; "say \" & $text & \"" using \" & $voice & \""  
speaking rate \" & $rate & \" pitch \" & $pitch ) ]
```

Show dialog:

```
Set Variable [ $r ; Value: MBS("AppleScript.Run"; "display dialog \"Did I start yet?\"") ]
```

Created 18th August 2014, last changed 9th February 2019.

35.10 AppleScript.SetPropertyValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
35 AppleScript	4.2	Yes	No	Yes, macOS only	No	No

MBS("AppleScript.SetPropertyValue"; Script ID; Name; Value)

Parameters

Script ID

The Id of the script you want to execute. This ID returned by the Applescript.Compile function.

1

Name

The name of the property.

"MyValue"

Value

The value of the property.

"Hello"

Result Returns OK or error.

Description

Lasterror is set.

Examples

Sets a property:

```
Set Variable [ $r; Value:MBS( "Applescript.SetPropertyValue"; $scriptID; "MySubject"; AppleScript Properties::Subject) ]
```

See also

- 35.2 AppleScript.Compile 927

Created 18th August 2014, last changed 31st October 2016.

35.11 Applescript.DeterminePermissionToAutomateTarget

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
?? Applescript	9.0	Yes	No	No	No	No

```
MBS( "Applescript.DeterminePermissionToAutomateTarget"; BundleID; AEEEventClass; AEEEventID { ;
askUserIfNeeded } )
```

Parameters

BundleID

The bundle ID of the application to control.

The target address descriptor must refer to a running application. If the target application is on another machine, then Remote AppleEvents must be enabled on that machine for the user.

"com.apple.Safari"

AEEEventClass

The event class of the Apple event to determine permission for. **** for wildcard to use all.

AEEEventID

The event ID of the Apple event to determine permission for. **** for wildcard to use all.

askUserIfNeeded

Optional

Whether dialog can show to ask user if needed. Pass 1 to allow dialog or 0 to disallow.

If 1, and if this application does not yet have permission to send events to the target application, then prompt the user to obtain permission. If 0, do not prompt the user. Default is 0.

1

Result Returns OK, ApplicationNotRunning, NotPermitted, WouldRequireUserConsent, or error.

Description

Determines whether the current application is able to send an AppleEvent with the given eventClass and eventID to the application described as target via bundle ID.

Mac OS 10.14 and later impose additional requirements on applications when they send AppleEvents to other applications in order to insure that users are aware of and consent to allowing such control or information exchange. Generally this involves the user being prompted in a secure fashion the first time an application attempts to send an AppleEvent to another application. If the user consents then this application can send events to the target. If the user does not consent then any future attempts to send AppleEvents will result in a failure with errAEEEventNotPermitted being returned.

Certain AppleEvents are allowed to be sent without prompting the user. Pass typeWildcard (****) for the eventClass and eventID to determine if every event is allowed to be sent from this application to the target.

Applications can determine, without sending an `AppleEvent` to a target application, whether they are allowed to send `AppleEvents` to the target with this function. If `askUserIfNeeded` is true, and this application does not yet have permission to send `AppleEvents` to the target, then the user will be asked if permission can be granted; if `askUserIfNeeded` is 0 and permission has not been granted, then `WouldRequireUserConsent` will be returned.

The target bundle ID must refer to an already running application.

If the current application is permitted to send the given `AppleEvent` to the target, then `OK` will be returned. If the current application is not permitted to send the event, `NotPermitted` will be returned. If the target application is not running, then `ApplicationNotRunning` will be returned. If `askUserIfNeeded` is false, and this application is not yet permitted to send `AppleEvents` to the target, then `WouldRequireUserConsent` will be returned.

Requires MacOS 10.14 or newer.

May not work in FileMaker 18 due to missing entitlements for the FileMaker app. You can try FileMaker 17 instead, where it works. Or run FileMaker 18 from Terminal, where it also works.

Examples

Ask for permissions for Safari:

```

Chapter 36

Archive

Functions to work with archives including zip, tar and bz2.

36.1 Archive.Compress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.Compress"; Format; Filter; Destination; BasePath; List { ; Options; Password })

Parameters

Format

The format to use. Formats: 7zip, ar, arbsd, argnu, arsvr4, bsdtar, cd9660, cpio, gnutar, iso, iso9660,mtree,mtree-classic, newc, odc, oldtar, pax, paxr, posix, raw, rpax, shar, shardedump, ustar, v7tar, v7, warc, xar, zip.

"zip"

Filter

The filter to use. For zip format can be store or deflate. Filters: b64encode, bzip2, compress, gzip, gzipped, lrzip, lz4, lzip, lzma, lzop, uuencode, xz, zstd.

Not all filters can be combined with all formats.

"deflate"

Destination

The native file path to the destination archive. Or file name for container.

"C:\test.zip"

BasePath

The bath path to the folder where to look for files.

"C:\test"

List

the list of files and folders to add to archive.

"test.txt"

Options

Optional

The options to pass to writer. This is a comma-separated list of options. Option names can be prefixed with module name.

Sample options: compression=9 zip:encryption=zipcrypt zip:encryption=aes128 zip:encryption=aes256 zip64
gzip:compression-level=9 hdrcharset=UTF-8

"zip:encryption=zipcrypt"

Password

Optional

The passphrase to use for password protection.

"secret"

Result Returns OK or error.

Description

Supports various compression algorithms and encryption.

The archive usually should not contain the absolute paths of the files, so we need a base path and relative to that base path the list of files and folders to zip.

Examples

Compression examples:

```
# list of files in the folder to archive
```

```
Set Variable [ $list ; Value: "minitar.c$simplebar.rbp" ]
```

```
# write zip file with password
```

```
Set Variable [ $r ; Value: MBS( "Archive.Compress"; "zip"; "deflate"; "/Users/cs/Desktop/minitar.zip";  
"/Users/cs/Desktop/"; $list; "zip:encryption=zipcrypt"; "secret password" ) ]
```

```
# Write bzip2 compress tar file:
```

```
Set Variable [ $r ; Value: MBS( "Archive.Compress"; "ustar"; "bzip2"; "/Users/cs/Desktop/minitar.tar";  
"/Users/cs/Desktop/" ) ]
```

```
# and write zip with aes encryption to container file:
```

```
Set Variable [ $r ; Value: MBS( "Archive.Compress"; "zip"; "deflate"; "minitar.zip"; "/Users/cs/Desktop/";  
$list; "zip:encryption=aes128"; "secret password" ) ]
```

```
Set Field [ Archive Read::Container ; $r ]
```

Compress with UTF-8 file names:

```
MBS( "Archive.Compress"; "zip"; "deflate"; "C:\Users\Christian\Desktop\test.zip"; "C:\Users\Christian\Desk-  
top"; "Bücher"; "hdrcharset=UTF-8" )
```

36.1. *ARCHIVE.COMPRESS* 945

36.1.1 Blog Entries

- [MBS FileMaker Plugin, version 9.1pr4](#)

Created 17th December 2018, last changed 9th December 2019.

36.2 Archive.Content

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.Content"; Archive { ; Passphrase })

Parameters

Archive

Either container with archive or native file path.

"C:\test\test.zip"

Passphrase

Optional

Password to use.

Result Returns JSON or error.

Description

JSON has an entry count for the file count, an entry format for the format type and an entry for files array.

Examples

Check archive content:

```
Set Variable [ $list ; Value: MBS("Archive.Content"; If(IsEmpty($Path); $Container; $Path)) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to read container" ; $list ]
Else
Set Field [ $Content ; MBS("JSON.Colorize"; $list) ]
End If
```

Get content of encrypted archive:

```
MBS( "Archive.Content";
"/Users/cs/Desktop/invoices-2019-02-12_1924.zip"; /* path to archive (or container) */
"98234kjh245234" /* password */) 
```

36.3 Archive.Extract

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.Extract"; Archive; FileList; DestinationFolder { ; Passphrase })

Parameters

Archive

Either container with archive or native file path.

"C:\test\test.zip"

FileList

Optional list of files to extract. Pass empty text when you need all files.

""

DestinationFolder

The native path to the destination folder.

"/Users/cs/Desktop"

Passphrase

Optional

Password to use.

Result Returns OK or error.

Description

Restores file permissions, times, Mac metadata and file flags.

Examples

Expand an archive:

```
MBS( "Archive.Extract";
"/Users/cs/Desktop/invoices-2019-02-12_1924.zip"; /* path to archive (or container) */
"" /* all files */;
"/Users/cs/Desktop/"; /* dest */
"98234kjh245234" /* password */)

```

See also

Created 11st December 2018, last changed 12nd February 2019.

36.4 Archive.FileList

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.FileList"; Archive { ; Passphrase })

Parameters

Archive

Either container with archive or native file path.

"C:\test\test.zip"

Passphrase

Optional

Password to use.

Result Returns list or error.

Description

Please use Archive.Content if you need more details.

This provides file list, which you can filter and then pass to Archive.Extract.

Examples

Get file list:

```
Set Variable [ $list ; Value: MBS("Archive.FileList"; If(IsEmpty($Path); $Container; $Path)) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to read container" ; $list ]
Else
Set Field [ $Content ; MBS("JSON.Colorize"; $list) ]
End If
```

Created 8th December 2018, last changed 17th December 2018.

36.5 Archive.LibVersion

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.LibVersion")

Result Returns text or error.

Description

Examples

Shows version of libarchive:

```
Show Custom Dialog [ "Archive" ; MBS( "Archive.LibVersion" ) ]
```

See also

36.6 Archive.LibVersionDetails

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.LibVersionDetails")

Result Returns text or error.

Description

Examples

Shows detailed version of libarchive:

Show Custom Dialog ["Archive" ; MBS("Archive.LibVersionDetails")]

See also

- 36.5 Archive.LibVersion

950

Created 8th December 2018, last changed 17th December 2018.

36.7 Archive.SupportedFormats

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.0	Yes	Yes	Yes	Yes	Yes

MBS("Archive.SupportedFormats")

Result Returns list or error.

Description

Currently, the list is ar, cpio, lha, mtree, tar, xar, warc, 7zip, cab, rar, iso9660, zip.

Read about supported formats on libArchive website:

<https://github.com/libarchive/libarchive/wiki/LibarchiveFormats>

Examples

Query formats:

```
Show Custom Dialog [ "Archive" ; MBS( "Archive.SupportedFormats" ) ]
```

Created 11st December 2018, last changed 17th December 2018.

36.8 Archive.Verify

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
36 Archive	9.2	Yes	Yes	Yes	Yes	Yes

MBS("Archive.Verify"; Archive { ; Passphrase })

Parameters

Archive

Either container with archive or native file path.

"C:\test\test.zip"

Passphrase

Optional

Password to use.

Result Returns OK or error.

Description

Same as Archive.Extract, but doesn't actually write anything.

Examples

Check an archive:

MBS("Archive.Verify"; "/Users/cs/Desktop/Archiv.zip")

Example result: "[MBS] ZIP decompression failed (-5)"

Created 20th March 2019, last changed 20th March 2019.

Chapter 37

Audit

Log all changes to your database.

For FileMaker Pro. We define fields in each table which trigger our Audit function, so with any change in a record, the plugin can keep track of changes.

37.1 Audit.Backup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	8.5	Yes	Yes	Yes	Yes	Yes

MBS("Audit.Backup"; timestamp; TableName { ; FieldsToIgnore })

Parameters

timestamp

Pass here the timestamp field you added for auditing to the table.

AuditTimeStamp

TableName

The name of the table.

"Firma"

FieldsToIgnore

Optional

A list of field names to ignore. Global fields and those set with Audit.SetIgnoredFieldNames are always ignored.

"myField"

Result Returns OK or error.

Description

Same as Audit.Changed, but uses Backup for the action field.

You can call this function before loading a record to make sure all data from the record are logged. Than you are sure to have old values for an undo.

See also

Created 27th October 2018, last changed 27th October 2018.

37.2 Audit.Backup2

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	8.5	Yes	Yes	Yes	Yes	Yes

MBS("Audit.Backup2"; timestamp; TableName; FieldsToCheck)

Parameters

timestamp

Pass here the timestamp field you added for auditing to the table.
AuditTimeStamp

TableName

The name of the table.
"Firma"

FieldsToCheck

A list of field names to check.
"myField"

Result Returns OK or error.

Description

Same as Audit.Changed2, but uses Backup for the action field.

You can call this function before loading a record to make sure all data from the record are logged. Than you are sure to have old values for an undo.

37.2.1 Blog Entries

- [MBS FileMaker Plugin, version 8.5pr4](#)

Created 27th October 2018, last changed 27th October 2018.

37.3 Audit.Changed

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	2.8	Yes	Yes	Yes	Yes	Yes

MBS("Audit.Changed"; timestamp; TableName { ; FieldsToIgnore })

Parameters

timestamp

Pass here the timestamp field you added for auditing to the table.

AuditTimeStamp

TableName

The name of the table.

"Firma"

FieldsToIgnore

Optional

A list of field names to ignore. Global fields and those set with Audit.SetIgnoredFieldNames are always ignored.

"myField"

Result Returns 1.

Description

In order to setup this for a table, please add two fields to the table. First a field called AuditTimeStamp which is of type timestamp. In the options enable in the Auto-Enter tab the option to set a new timestamp on modification. Next create a new field AuditState and make it a calculated value with the calculation MBS("Audit.Changed"; AuditTimeStamp; TableName). The Field "AuditTimeStamp" can be renamed to something like "sAuditTS" but has to be correctly referred to and should be included in the "Audit.SetIgnoredFieldNames" call if changed. By passing here an auto entered modification timestamp you make sure the plugin is informed about all changes to this table. Please uncheck the checkbox for "Do not replace existing value of field (if any)".

For logging you need a table named AuditLog with a few fields. Required are fields named FieldName, FieldHash, TableName, RecordID. Optionally you can add more fields: FieldValue, FieldOldValue, FieldType, UserName, IP, CurrentTimestamp, TimeStamp, CurrentTime, CurrentDate, Action, CurrentHostTimeStamp, PrivilegeSetName, AccountName, LayoutNumber, ApplicationVersion, FileName, HostApplicationVersion, HostName, HostIPAddress, LayoutName, PageNumber, LayoutTableName, TableID, FieldID, CurrentTimeUTCMilliseconds, ScriptName and WindowName.

The plugin will fill those fields with values evaluated from Get() function. FieldOldValue is only filled if we find an older log entry for the field based on the hash. With 4.2 plugin you can also use field Platform to know if plugin was executed on server or client.

You can get access of a record logged if you use a script trigger to set the AuditTimeStamp field with a new timestamp whenever a record is loaded.

This functions work even with separated files where data and layouts are in separated database files. The AuditLog table can be in a separated file as long as the plugin can find a table occurrence named "AuditLog", referencing to the original table which may be located in another FileMaker file and a layout based on this table occurrence, named "AuditLog", to write into the log.

The two fields AuditTimeStamp and AuditState can have different names. In that case we recommend to call Audit.SetIgnoredFieldNames in order to have the plugin ignore those fields. Or pass the field names to this function.

To get all your existing records introduced to this Audit Function, move over all records in a loop in a script and call Audit.Changed to log the current one. This helps to fill the FieldOldValue field. And finally if you like, you can even built yourself an undo mechanism by restoring changes.

On FileMaker 10 the Audit functions only work if tables and base tables have same name. Also we can't record FieldID or TableID on FileMaker 10. For FileMaker 11 and 12 everything works nice.

In the fields to ignore parameters you can pass extra values "FieldName | Value" to assign special values automatically to your fields. As this parameter can be build with a calculation, you can query variables or other tables for information you want to log. With plugin version 7.2 and newer this works for number fields in addition to text fields.

Table names are case sensitive. If you change case of a table name, the fields may be logged again. With plugin version 4.4 you can use * on the end of the name to match all names starting with same text.

Indexes in the AuditLog table help to speedup the queries internally made by plugin. Especially indexes for the fields FieldHash, FieldName, RecordID and TableName.

Version 8.5 can use either FieldName or FieldID in AuditLog table to identify the field. For the value we prefer to use FieldHash, but if you have no such field, we use FieldValue. AuditLog field list is now queried via SQL instead of using a layout. So with version 8.5 the AuditLog layout is optional.

If there is a failure in the generated SQL, you may see it with FM.ExecuteSQL.LastErrorMessage and FM.ExecuteSQL.LastSQL functions.

Examples

Log record on changes:

```
MBS( "Audit.Changed"; MyTable::AuditTimeStamp; "MyTable" )
```

Log record on changes except fields fullname and zipCity:

```
MBS( "Audit.Changed"; MyTable::AuditTimeStamp; "MyTable"; "fullname"; "zipCity" )
```

Log change and pass value for custom log field "InsideScript" with value of variable:

```
MBS("Audit.Changed"; AuditTimeStamp; "Audit"; "InsideScript | " & $$InsideScript)
```

Log changes and pass custom GUID field while also checking a global variable to disable auditing for batch imports:

```
If ($$AuditDisabled; 0;
MBS("Audit.Changed"; AuditTimeStamp; "Audit"; "GUID | " & GUID)
)
```

Run Audit.Changed with list of fields in a global field in the table:

```
Evaluate("MBS(\\"Audit.Changed\\"; GetAsTimeStamp(\\"" & Events::AuditTimeStamp & "\\"); \\"Events\\";
\\"" & Substitute(Events::AuditFields; "$"; "\\"; \\"") & "\\")")
```

Run Audit with GetFieldName with v8.3 or newer:

```
MBS("Audit.Changed2"; // call with positive list
AuditTimeStamp; // the timestamp field to trigger this
"Audit"; // the name of table
GetFieldName ( SomeText); // the fields to check
GetFieldName ( SomeNumber);
GetFieldName ( SomeTime);
GetFieldName ( SomeTimeStamp);
GetFieldName ( SomeContainer);
"InsideScript | " & $$InsideScript) // and we pass an extra field with global variable
```

37.4 Audit.Changed2

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	3.1	Yes	Yes	Yes	Yes	Yes

MBS("Audit.Changed2"; timestamp; TableName; FieldsToCheck)

Parameters

timestamp

Pass here the timestamp field you added for auditing to the table.

AuditTimeStamp

TableName

The name of the table.

"Firma"

FieldsToCheck

A list of field names to check.

"myField"

Result Returns 1.

Description

With plugin version 4.4 you can use * on the end of the name to match all names starting with same text.

The Audit.Changed2 function with passing field list is quicker than the Audit.Changed function as we skip querying the field list from FileMaker.

Examples

Log record on changes:

```
MBS( "Audit.Changed2"; MyTable::AuditTimeStamp; "MyTable"; "firstName"; "lastName"; "age" )
```

Run Audit.Changed2 with list of fields in a global field in the table:

```
Evaluate("MBS(\ Audit.Changed2\ "; GetAsTimeStamp(\ "" & Events::AuditTimeStamp & "\"); \ Events\ ";
\ "" & Substitute(Events::AuditFields; "$"; "\"; \") & "\")")
```

Run Audit with GetFieldName with v8.3 or newer:

```
MBS("Audit.Changed2"; // call with positive list
AuditTimeStamp; // the timestamp field to trigger this
"Audit"; // the name of table
GetFieldName ( SomeText); // the fields to check
GetFieldName ( SomeNumber);
GetFieldName ( SomeTime);
GetFieldName ( SomeTimeStamp);
GetFieldName ( SomeContainer);
```

37.4. *AUDIT.CHANGED2* 963

”InsideScript | ” & \$\$InsideScript) // and we pass an extra field with global variable

37.6 Audit.Delete

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	2.8	Yes	Yes	Yes	Yes	Yes

MBS("Audit.Delete"; TimeStamp; TableName { ; FieldsToIgnore })

Parameters

TimeStamp

Pass here the timestamp field you added for auditing to the table.

AuditTimeStamp

TableName

The name of the table.

"Firma"

FieldsToIgnore

Optional

A list of field names to ignore. Global fields and those set with Audit.SetIgnoredFieldNames are always ignored.

"myField"

Result Returns 1.

Description

In order to log record deletion, please go to "Manage Accounts & Privileges" dialog in FileMaker. Check the Privileges Sets tab and create a new custom privilege set. You can duplicate one of the existing ones like the "Data Entry Only" set. Edit the new privilege set and select for Records the custom privileges option in the popupmenu. For the custom record privileges, you choose for delete the limited option in the popupmenu. Now in the specify calculation dialog, you enter the function: MBS("Audit.Delete"). Done for this table. Repeat for other tables and for other privilege sets you need.

The plugin will analyse the record on deletion now and write down values to AuditLog table with Create/Changed entries if the record was not yet analyzed or not completely analyzed so far. Finally for a delete operation, it logs a delete entry.

In the fields to ignore parameters you can pass also "FieldName | Value" to assign special values automatically. As this parameter can be build with a calculation, you can query variables or other tables for information you want to log.

You can call Audit.SetIgnoredFieldNames in order to have the plugin ignore some fields. Or pass the field names to this function.

Be aware that even if you call this function from the calculation in privileges the deletion may be cancelled later and you have deleted logged, but not executed. You can work around by implementing your own dialog for user to cancel.

Examples

Log record on delete:

```
MBS( "Audit.Delete"; MyTable::AuditTimeStamp; "MyTable" )
```

37.7 Audit.Delete2

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	3.1	Yes	Yes	Yes	Yes	Yes

MBS("Audit.Delete2"; timestamp; TableName; FieldsToCheck)

Parameters

timestamp

Pass here the timestamp field you added for auditing to the table.
AuditTimeStamp

TableName

The name of the table.
"Firma"

FieldsToCheck

A list of field names to check.
"myField"

Result Returns 1.

Description

Examples

Log record on delete:

```
MBS( "Audit.Delete2"; MyTable::AuditTimeStamp; "MyTable"; "firstName"; "lastName"; "age" )
```

37.8 Audit.FieldIDForName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	8.2	Yes	Yes	Yes	Yes	Yes

MBS("Audit.FieldIDForName"; TableName; FieldName)

Parameters

TableName

The table name or ID. Can be ID of table, so we lookup name by ID. Can be result of GetFieldName() function as we remove field name automatically.

"MyTable"

FieldName

The field name to lookup.

"123"

Result Returns text or error.

Description

Returns empty result if not found.

Examples

Queries field named for third field in a table by ID:

```
MBS( "Audit.FieldNameForID"; "1065089"; 3 )
```

Example result: "First"

Queries field name for 4th field:

```
MBS( "Audit.FieldNameForID"; "Contacts"; 4 )
```

Example result: "Last"

Created 20th April 2018, last changed 17th January 2020.

37.9 Audit.FieldNameForID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	8.0	Yes	Yes	Yes	Yes	Yes

MBS("Audit.FieldNameForID"; TableName; FieldID)

Parameters

TableName

The table name or ID. Can be ID of table, so we lookup name by ID. Can be result of GetFieldName() function as we remove field name automatically.

"MyTable"

FieldID

The field ID to lookup.

1

Result Returns field name or error.

Description

Returns empty result if not found.

Version 8.2 allows you to pass table reference by ID.

Examples

Query first field name in Kontakte:

MBS("Audit.FieldNameForID"; "Kontakte"; 1)

Example result: "KONTAKT_ID ABGLEICHSFELD"

37.16 Audit.GetUUIDField

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	7.3	Yes	Yes	Yes	Yes	Yes

MBS("Audit.GetUUIDField")

Result Returns OK or error.

Description

See also

- 37.23 Audit.SetUUIDField

984

Created 15th May 2017, last changed 15th May 2017.

37.17 Audit.SetEnabled

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	7.1	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetEnabled"; State)

Parameters

State

The new state. Pass 1 to enable or 0 to disable.

1

Result Returns OK or error.

Description

Default is enabled.

You can turn off for batch imports.

The Audit.Changed, Audit.Changed2, Audit.Delete and Audit.Delete2 functions return 1 if disabled, so any boolean operation using the result still works.

Examples

Enable audit globally:

```
MBS( "Audit.SetEnabled"; 1 )
```

Disable audit globally:

```
MBS( "Audit.SetEnabled"; 0 )
```

37.18 Audit.SetIgnoreCalculations

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	4.4	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetIgnoreCalculations"; Value)

Parameters

Value

The new setting. 1 to ignore and 0 to audit.

1

Result Returns OK or error.

Description

Unstored calculations are always ignored. This setting allows you to disable auditing of stored calculations. Due to field type caching, setting this property does not take effect immediately.

37.19 Audit.SetIgnoreSummaryFields

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	5.4	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetIgnoreSummaryFields"; Value)

Parameters

Value

The new setting. 1 to ignore and 0 to audit.

1

Result Returns OK or error.

Description

Unstored calculations are always ignored. This setting allows you to disable auditing of summary fields. Due to field type caching, setting this property does not take effect immediately.

Examples

Disable summary field auditing:

```
MBS("Audit.SetIgnoreSummaryFields"; 1)
```

37.20 Audit.SetIgnoreUnderscoreFieldNames

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	5.3	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetIgnoreUnderscoreFieldNames"; Value)

Parameters

Value

The new setting. Can be 0 or 1.

1

Result Returns OK or error.

Description

If you have internal fields in a table like creation date and you store it in a field starting with `_` in the name, we can automatically ignore those fields.

Examples

Enable ignoring of underscore field names:

MBS("Audit.SetIgnoreUnderscoreFieldNames"; 1)

See also

- [37.13 Audit.GetIgnoreUnderscoreFieldNames](#) 973

37.20.1 Blog Entries

37.21 Audit.SetIgnoredFieldNames

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	2.8	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetIgnoredFieldNames"; fields)

Parameters

fields

The field name to ignore. Pass one parameter per field. Version 7.3 or newer accepts a list of names here. "MyField"

Result Returns OK on success.

Description

Default is "AuditState" and "AuditTimeStamp".

Best you call it once at startup of your solution.

With plugin version 4.4 you can use * on the end of the name to match all names starting with same text. This list is not limited. You can make a list as long as stuff fit in memory.

With plugin version 7.3 this can be a list of field names in each fields parameter.

Examples

Set ignored field names:

```
MBS( "Audit.SetIgnoredFieldNames"; "sAuditState"; "sAuditTimeStamp" )
```

Set ignored field names with a list of names:

```
MBS( "Audit.SetIgnoredFieldNames"; "sAuditState$sAuditTimeStamp" )
```

37.22 Audit.SetLogAccess

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	4.1	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetLogAccess"; value)

Parameters**value**

The new setting. Can be 0 or 1.

0

Result Returns OK or error.

Description

If a record is modified which the plugin does not log as fields are disabled for logging, the plugin will write an entry with access action. If you set this to zero, the access log entry is not written.

See also [Audit.GetLogAccess](#).

Examples

Disable access logging:

MBS("Audit.SetLogAccess"; 0)

See also

- [37.15 Audit.GetLogAccess](#)

37.23 Audit.SetUUIDField

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	7.3	Yes	Yes	Yes	Yes	Yes

MBS("Audit.SetUUIDField"; FieldName)

Parameters

FieldName

The field name.

"UUID"

Result Returns OK or error.

Description

If set, we use UUIDs for Record IDs. The name given here should be used in all tables for the unique ID field.

If no field with that name is in a table, we fall back to the normal RecordID.

Please add a field named UUID to the AuditLog table (and layout), so the plugin can fill and query this field.

Examples

Defines UUID to be the field where we store unique record IDs:

```
MBS( "Audit.SetUUIDField"; "UUID" )
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	8.2	Yes	Yes	Yes	Yes	Yes

MBS("Audit.TableIDForName"; TableName)

Parameters

TableName

The table name to lookup.
"Contacts"

Result Returns text or error.

Description

Returns empty result if not found.

Examples

Queries ID for name:

MBS("Audit.TableIDForName"; "Contacts")

Example result: 1065089

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
37 Audit	8.0	Yes	Yes	Yes	Yes	Yes

MBS("Audit.TableNameForID"; TableID)

Parameters

TableID

The table ID to lookup.

1

Result Returns name or error.

Description

Returns empty result if not found.

Examples

Query table name:

MBS("Audit.TableNameForID"; 1065089)

Example result: "Kontakte"

Chapter 38

AVAsset

Modern functions on OS X to query metadata from movie files.

Extract video frames, query lyrics and other metadata from video files.

38.1 AVAsset.AvailableMetadataFormats

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.AvailableMetadataFormats"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns list or error.

Description

Metadata formats may include ID3, iTunes metadata, and so on.

Examples

Queries available metadata formats:

MBS("AVAsset.AvailableMetadataFormats"; \$asset)

See also

- 38.14 AVAsset.MetadataKeys

- 38.18 AVAsset.OpenFile 1008
- 38.19 AVAsset.OpenURL 1010

Example Databases

- [Mac only/Movies/AVAsset Test](#)

Created 19th June 2015, last changed 19th June 2015.

38.2 AVAsset.Duration

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Duration"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns value or error.

Description

Examples

Query duration of a video:

MBS("AVAsset.Duration"; \$asset)

See also

- [38.17 AVAsset.OpenContainer](#) 1006
- [38.18 AVAsset.OpenFile](#) 1008
- [38.19 AVAsset.OpenURL](#) 1010

Example Databases

- [Mac and iOS/AVExport](#)
- [Mac only/Movies/AVAsset Test](#)

Created 19th June 2015, last changed 7th October 2015.

38.3 AVAsset.Framerate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Framerate"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns number or error.

Description

Actual frame rate may be variable.

Examples

Queries framerate for file:

```
Set Variable [ $Asset; Value:MBS( "AVAsset.OpenFile"; "/Users/cs/Desktop/test.mp4" ) ]
```

```
Set Variable [ $Framerate; Value:MBS( "AVAsset.Framerate"; $Asset ) ]
```

```
Set Variable [ $r; Value:MBS( "AVAsset.Release"; $Asset ) ]
```

```
Show Custom Dialog [ "Framerate"; $Framerate ]
```

Created 1st August 2015, last changed 24th February 2016.

38.4 AVAsset.HasProtectedContent

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.HasProtectedContent"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns 1, 0 or error.

Description

Examples

Checks protection status:

MBS("AVAsset.HasProtectedContent"; \$status)

See also

- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008

Created 19th June 2015, last changed 29th July 2017.

38.5 AVAsset.Image

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Image"; Asset; Time { ; ImageType; Filename; Width; Height })

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Time

The position in the video in seconds.

5.2

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Width

Optional

The maximum width to use.

500

Height

Optional

The maximum height to use.

500

Result Returns container value with image or error.

Description

The time may not exactly be possible, so a nearby frame may be picked.

You can call AVAsset.RequestImageTimePrecision before to request exact timings for images. Query AVAsset.ImageActualTime function to see which time the image was created from.

Examples

Queries image at 5 seconds:

```
MBS( "AVAsset.Image"; $asset; 5; "jpeg"; "preview.jpg")
```

38.6 AVAsset.ImageActualTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	6.5	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.ImageActualTime"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns number or error.

Description

After a call to AVAsset.Image, this returns the time of the picture you got.
Returns number of seconds.

Examples

Query image and time:

```
Set Variable [ $a ; Value: MBS( "AVAsset.OpenFile"; "/Users/cs/Desktop/Trampolin.mov" ) ]
```

```
Set Field [ test::Image ; MBS( "AVAsset.Image"; $a; 5; "JPEG"; "frame.jpg" ) ]
```

```
Show Custom Dialog [ "Image requested at 5 seconds and got image from:" ; MBS( "AVAsset.ImageActualTime"; $a ) ]
```

```
Set Variable [ $r ; Value: MBS( "AVAsset.Release"; $a ) ]
```

38.7 AVAsset.IsComposable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.IsComposable"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns 1, 0 or error.

Description

Examples

Checks composable status:

MBS("AVAsset.IsComposable"; \$asset)

See also

- 38.8 AVAsset.IsExportable 996
- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008

Created 19th June 2015, last changed 19th June 2015.

38.8 AVAsset.IsExportable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.IsExportable"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns 1, 0 or error.

Description

Examples

Checks export status:

MBS("AVAsset.IsExportable"; \$asset)

See also

- 38.7 AVAsset.IsComposable 995
- 38.17 AVAsset.OpenContainer 1006

Created 19th June 2015, last changed 19th June 2015.

38.9 AVAsset.IsPlayable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.IsPlayable"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns 1, 0 or error.

Description

Examples

Checks play status:

MBS("AVAsset.IsPlayable"; \$asset)

See also

- 38.10 AVAsset.IsReadable 998
- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008
- 38.19 AVAsset.OpenURL 1010

Created 19th June 2015, last changed 9th June 2018.

38.10 AVAsset.IsReadable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.IsReadable"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns 1, 0 or error.

Description

Examples

Checks play status:

MBS("AVAsset.IsReadable"; \$asset)

See also

- 38.9 AVAsset.IsPlayable 997

Created 19th June 2015, last changed 19th June 2015.

38.11 AVAsset.Loaded

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Loaded"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns status or error.

Description

Returns status like Loading, Loaded, Cancelled, Failed or Unknown.

If status starts with "Failed: ", it is followed by a reason.

Examples

Load and check status:

```
Set Variable [ $Asset; Value:MBS( "AVAsset.OpenFile"; "/Users/cs/Desktop/test.mp4" ) ]
```

```
Set Variable [ $Loaded1; Value:MBS( "AVAsset.Loaded"; $Asset ) ]
```

```
Pause/Resume Script [ Duration (seconds): ,1 ]
```

```
Set Variable [ $Loaded2; Value:MBS( "AVAsset.Loaded"; $Asset ) ]
```

```
Set Variable [ $r; Value:MBS( "AVAsset.Release"; $Asset ) ]
```

```
Show Custom Dialog [ "Loaded"; $Loaded1 & $& $Loaded2 ]
```

Created 19th June 2015, last changed 24th February 2016.

38.12 AVAsset.Lyrics

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Lyrics"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns text or error.

Description

Can be empty.

Examples

Queries lyrics:

MBS("AVAsset.Lyrics"; \$asset)

See also

- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008

38.13 AVAsset.Metadata

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Metadata"; Asset; Key)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Key

The metadata key to query.

Result Returns OK or error.

Description

Examples

Queries title:

MBS("AVAsset.Metadata"; "40001"; "uiso/titl")

See also

- [38.14 AVAsset.MetadataKeys](#) 1002

Created 19th June 2015, last changed 19th June 2015.

38.14 AVAsset.MetadataKeys

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.MetadataKeys"; Asset { ; Format })

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Format

Optional

The metadata format to use.

"com.apple.quicktime.udta"

Result Returns list or error.

Description

You can pass empty format to query all keys.

Or you use AVAsset.AvailableMetadataFormats to query the list of formats and limit query to only the given format.

Examples

Queries metadata keys:

MBS("AVAsset.MetadataKeys"; "40001")

See also

38.15 AVAsset.NaturalHeight

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.NaturalHeight"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns value or error.

Description

Examples

Query size of video:

MBS("AVAsset.NaturalWidth"; \$asset) & "x" & MBS("AVAsset.NaturalHeight"; \$asset)

See also

- 38.16 AVAsset.NaturalWidth 1005
- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008
- 38.19 AVAsset.OpenURL 1010

Created 19th June 2015, last changed 19th June 2015.

38.16 AVAsset.NaturalWidth

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.NaturalWidth"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns value or error.

Description

Examples

Query size of video:

MBS("AVAsset.NaturalWidth"; \$asset) & "x" & MBS("AVAsset.NaturalHeight"; \$asset)

See also

- 38.15 AVAsset.NaturalHeight 1004

Created 19th June 2015, last changed 19th June 2015.

38.17 AVAsset.OpenContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.OpenContainer"; Container)

Parameters

Container

The container with the movie file.

MyTable::MovieContainer

Result Returns asset reference number or error.

Description

Should work for external and internal containers.

Please allow a second to load video in background asynchronously.

Available in OS X v10.7 and later.

Please call AVAsset.Release later to free object from memory.

Examples

Open movie from container:

```
MBS( "AVAsset.OpenContainer"; MyTable::MyContainer )
```

Close it later

```
MBS( "AVAsset.Release"; $asset )
```

38.18 AVAsset.OpenFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.OpenFile"; Path)

Parameters

Path

The native file path to the movie file.

"/Test.mov"

Result Returns asset reference number or error.

Description

Please allow a second to load video in background asynchronously.
Available in OS X v10.7 and later.

Please call AVAsset.Release later to free object from memory.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Opens a movie file:

```
MBS( "AVAsset.OpenFile"; "/Users/cs/Desktop/test.mp4" )
```

Close it later

```
MBS( "AVAsset.Release"; $asset )
```

38.19 AVAsset.OpenURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.OpenURL"; URL)

Parameters

URL

The URL of the movie to open.

"http://example.test/mysound.mp3"

Result Returns asset reference number or error.

Description

Please allow a second to load video in background asynchronously.
Available in OS X v10.7 and later.

Please call AVAsset.Release later to free object from memory.

Examples

Opens movie file with URL:

MBS("AVAsset.OpenURL"; "file:/Users/cs/Desktop/test.mp4")

Close it later

MBS("AVAsset.Release"; \$asset)

38.20 AVAsset.PreferredRate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.PreferredRate"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns value or error.

Description

This value is often, but not always, 1.0.

Examples

Query preferred rate:

MBS("AVAsset.PreferredRate"; \$asset)

See also

- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008
- 38.19 AVAsset.OpenURL 1010

Created 19th June 2015, last changed 19th June 2015.

38.21 AVAsset.PreferredVolume

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.PreferredVolume"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns value or error.

Description

Range from 0 to 1. This value is often, but not always, 1.0.

Examples

Query preferred volume:

MBS("AVAsset.PreferredVolume"; \$asset)

See also

38.22 AVAsset.Release

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.Release"; Asset)

Parameters

Asset

The reference number of the asset. Please use `AVAsset.OpenContainer`, `AVAsset.OpenFile` or `AVAsset.OpenURL` function to get asset reference.

\$asset

Result Returns OK or error.

Description

Please call this when you are done with an asset.

Examples

Release a video:

MBS("AVAsset.Release"; \$asset)

See also

38.23 AVAsset.RequestImageTimePrecision

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	6.5	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.RequestImageTimePrecision"; Asset; toleranceBefore; toleranceAfter)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

toleranceBefore

Time tolerance in seconds before requested time.

0

toleranceAfter

Time tolerance in seconds after requested time.

0

Result Returns OK or error.

Description

The actual time of the generated images will be within the range [requestedTime-toleranceBefore, requestedTime+toleranceAfter] and may differ from the requested time for efficiency.

Pass 0 for both toleranceBefore and toleranceAfter to request frame-accurate image generation; this may incur additional decoding delay. Default is infinity.

Examples

Request exact timing:

```
MBS("AVAsset.RequestImageTimePrecision"; $asset; 0; 0)
```

Request \pm 0.5 seconds

```
MBS("AVAsset.RequestImageTimePrecision"; $asset; 0.5; 0.5)
```

38.24 AVAsset.TimeCodes

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.4	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.TimeCodes"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns text or error.

Description

Returns list of timecodes in format HH:MM:SS:FF.

Examples

Read time codes from a mov file:

```
Set Variable [ $asset; Value:MBS("AVAsset.OpenFile"; "/Users/cs/Downloads/test.MOV") ]
```

```
Set Variable [ $timecode; Value:MBS("AVAsset.TimeCodes"; $asset) ]
```

```
Set Variable [ $r; Value:MBS("AVAsset.Release"; $asset) ]
```

```
Set Field [ test::timecodes; $timecode ]
```

38.25 AVAsset.TrackCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.TrackCount"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns track count or error.

Description

Examples

Query track count:

MBS("AVAsset.TrackCount"; \$asset)

See also

38.26 AVAsset.TrackInfo

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.TrackInfo"; Asset; TrackIndex; Selector)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

TrackIndex

The track index from 0 to AVAsset.TrackCount-1.

0

Selector

Which value to get.

"MediaType"

Result Returns OK or error.

Description

Allows you to query values for track.

Examples

Query media subtype:

MBS("AVAsset.TrackInfo"; \$Asset; 0; "MediaSubType")

See also

Created 29th July 2017, last changed 30th July 2017.

Selector	Description
trackID	Indicates the persistent unique identifier for this track of the asset
mediaType	Indicates the media type for this track as 4 letter code. e.g. "vide" for video or "soun" for sound.
playable	Indicates whether the receiver is playable in the current environment.
enabled	Indicates whether the track is enabled according to state stored in its container or construct.
selfContained	Indicates whether the track references sample data only within its storage container.
totalSampleDataLength	Indicates the total number of bytes of sample data required by the track.
estimatedDataRate	Indicates the estimated data rate of the media data referenced by the track, in units of bits per second.
naturalTimeScale	Indicates a timescale in which time values for the track can be operated upon without extraneous numerical conversion.
languageCode	Indicates the language associated with the track, as an ISO 639-2/T language code; may be "" if no language is indicated.
extendedLanguageTag	Indicates the language tag associated with the track, as an IETF BCP 47 (RFC 4646) language identifier; may be "" if no language tag is indicated.
naturalWidth	Indicates the natural dimensions of the media data referenced by the track.
naturalHeight	Indicates the natural dimensions of the media data referenced by the track.
preferredVolume	Indicates the volume specified in the track's storage container as the preferred volume of the audible media data.
nominalFrameRate	For tracks that carry a full frame per media sample, indicates the frame rate of the track in units of frames per second.
minFrameDuration	Indicates the minimum duration of the track's frames; the value will be kCM-TimeInvalid if the minimum frame duration is not known or cannot be calculated.
timeRangeStart	Indicates the time range of the track within the overall timeline of the asset
timeRangeDuration	Indicates the time range of the track within the overall timeline of the asset
preferredTransform	Indicates the transform specified in the track's storage container as the preferred transformation of the visual media data for display purposes; its value is often but not always identity
MediaSubType	The media subtype (codec).

38.27 AVAsset.URL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	5.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.URL"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns URL as text or error.

Description

Empty if no URL is available.

Examples

Queries URL used to open movie:

MBS("AVAsset.URL"; \$asset)

See also

- 38.17 AVAsset.OpenContainer 1006
- 38.18 AVAsset.OpenFile 1008
- 38.19 AVAsset.OpenURL 1010

Created 19th June 2015, last changed 30th May 2017.

38.28 AVAsset.WaitForLoaded

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
38 AVAsset	8.0	Yes	No	Yes, macOS only	No	Yes

MBS("AVAsset.WaitForLoaded"; Asset)

Parameters

Asset

The reference number of the asset. Please use AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL function to get asset reference.

\$asset

Result Returns status or error.

Description

Returns status like Loading, Loaded, Cancelled, Failed or Unknown.

If status starts with "Failed: ", it is followed by a reason.

While AVAsset.Loaded returns directly and may return "Loading", this function can be called after AVAsset.OpenFile, AVAsset.OpenURL or AVAsset.OpenContainer to have the script wait for assets to load.

Examples

Load asset:

```
Set Variable [ $path ; Value: "/Users/cs/Movies/video.mov" ]
Set Variable [ $asset ; Value: MBS("AVAsset.OpenFile"; $path) ]
# now wait a few milliseconds to load
Set Variable [ $r1 ; Value: MBS( "AVAsset.WaitForLoaded"; $asset ) ]
# check status
Set Variable [ $r2 ; Value: MBS( "AVAsset.Loaded"; $asset ) ]
Show Custom Dialog [ "Loaded" ; $r1 & $r2 ]
Set Variable [ $r3 ; Value: MBS( "AVAsset.Release"; $asset ) ]
```

Created 9th January 2018, last changed 9th January 2018.

Chapter 39

AVExport

Modern functions on OS X to transcode video in different format.

Can be used to compress videos as MPEG 4 video file.

39.1 AVExport.AllExportPresets

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.AllExportPresets")

Result Returns list or error.

Description

Apple may add new export presets, so you can use this function to determinate which presets are available for the given OS X installation.

Examples

Query all presets:

MBS("AVExport.AllExportPresets")

See also

- 39.7 AVExport.ExportSession 1035
- 39.8 AVExport.ExportSessionMerge 1038

Example Databases

- [Mac only/Movies/AVAsset Export Session](#)

39.2 AVExport.CancelExport

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.CancelExport"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns OK or error.

Description

Cancel can be invoked when the export is running.

Examples

Cancel export:

```
Set Variable [ $r; Value:MBS( "AVExport.CancelExport"; $$AVExport ) ]
```

Example Databases

- [Mac and iOS/AVExport](#)
- [Mac only/Movies/AVAsset Export Session](#)

Created 29th February 2016, last changed 1st March 2016.

39.3 AVExport.Duration

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.Duration"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns number or error.

Description

Returns duration in seconds.

Examples

Query duration:

```
Set Field [ AVAsset Export Session::Duration; MBS( "AVExport.Duration"; $$AVExport ) ]
```

See also

- [39.7 AVExport.ExportSession](#) 1035
- [132.2 QTExport.Duration](#) 6551

Example Databases

Created 29th February 2016, last changed 1st March 2016.

39.4 AVExport.Error

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.Error"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns text or error.

Description

See also

- 39.23 AVExport.Status

1055

Example Databases

- [Mac only/Movies/AVAsset Export Session](#)

Created 29th February 2016, last changed 29th February 2016.

39.5 AVExport.EstimatedOutputFileLength

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.EstimatedOutputFileLength"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns number or error.

Description

Returns zero when export preset is Passthrough or AppleProRes422LPCM. This property will also return zero if a numeric value (ie. not invalid, indefinite, or infinite) for the timeRange property has not been set.

Example Databases

- [Mac only/Movies/AVAsset Export Session](#)

Created 29th February 2016, last changed 29th February 2016.

39.6 AVExport.ExportAsynchronously

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.ExportAsynchronously"; AVExportSession)

Parameters**AVExportSession**

The session reference number.

\$AVExport

Result Returns OK or error.

Description

Starts the asynchronous execution of an export session.

If internal preparation for export fails, the export fails directly.

You must set output path or URL before starting export.

Please check AVExport.Status and AVExport.Progress regularly for updates.

Examples

Start export:

```
Set Variable [ $r; Value:MBS( "AVExport.ExportAsynchronously"; $$AVExport ) ]
```

```
If [ MBS("ISError") ]
```

```
Show Custom Dialog [ "Failed to start export session"; MBS("Text.RemovePrefix"; $r; " [ MBS ] ") ]
```

```
Exit Script [ ]
```

```
End If
```

```
Install OnTimer Script [ "Update Status"; Interval: .5 ]
```

Created 29th February 2016, last changed 1st March 2016.

39.7 AVExport.ExportSession

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.ExportSession"; Asset; Preset)

Parameters

Asset

The reference number of the asset. Please use `AVAsset.OpenContainer`, `AVAsset.OpenFile` or `AVAsset.OpenURL` function to get asset reference.

\$asset

Preset

The preset name to use. Can be one of the presets returned by `AVExport.AllExportPresets` or one of the predefined ones:

"640x480"

Result Returns reference number or error.

Description

Returns a reference number for the new `AVAsset` export session for the specified source asset and preset.

Presets:

These export options can be used to produce movie files with video size appropriate to the device. The export will not scale the video up from a smaller size. The video will be compressed using H.264 and the audio will be compressed using AAC.

LowQuality	Low Quality	OS X 10.11 and newer
MediumQuality	Medium Quality	OS X 10.11 and newer
HighestQuality	High Quality	OS X 10.11 and newer

These export options can be used to produce movie files with the specified video size.

The export will not scale the video up from a smaller size. The video will be compressed using H.264 and the audio will be compressed using AAC. Some devices cannot support some sizes.

640x480	VGA Resolution, 640 x 480 Pixel	OS X 10.7 and newer
960x540	Half HD Resolution, 960 x 540 Pixel	OS X 10.7 and newer
1280x720	720p Resolution, 1280 x 720 Pixel	OS X 10.7 and newer
1920x1080	Full HD Resolution, 1920 x 1080 Pixel,	OS X 10.7 and newer
3840x2160	4K Resolution, 3840 x 2160	OS X 10.10 and newer

These export options are used to produce files that can be played on the specified Apple devices. These presets are available for Desktop export only. The files should have .m4v extensions (or .m4a for exports

with audio only sources).

AppleM4VCellular	Cellular	OS X 10.7 and newer
AppleM4ViPod	iPod	OS X 10.7 and newer
AppleM4V480pSD	480p SD	OS X 10.7 and newer
AppleM4VAppleTV	AppleTV	OS X 10.7 and newer
AppleM4VWiFi	Wifi	OS X 10.7 and newer
AppleM4V720pHD	720p HD	OS X 10.7 and newer
AppleM4V1080pHD	1080p HD	OS X 10.8 and newer

Passthrough export option will cause the media of all tracks to be passed through to the output exactly as stored in the source asset, except for tracks for which passthrough is not possible, usually because of constraints of the container format as indicated by the specified `outputFileType`. This option is not included in the arrays returned by `AVExport.AllExportPresets`.

Passthrough	Pass through data if possible.	OS X 10.7 and newer
AppleM4A	Audio-only .m4a file with appropriate iTunes gapless playback data	OS X 10.7 and newer
AppleProRes422LPCM	QuickTime movie with Apple ProRes 422 video and LPCM audio.	OS X 10.7 and newer

Examples

Create export session:

```

If [ not IsEmpty($$AVExport) ]
Show Custom Dialog [ "We have a session already!?" ]
Exit Script [ ]
End If
Set Variable [ $Asset; Value:MBS( "AVAsset.OpenFile"; AVAsset Export Session::Input File Path ) ]
Set Variable [ $$AVExport; Value:MBS( "AVExport.ExportSession"; $Asset; AVAsset Export Session::PresetName ) ]
If [ MBS("IsError") ]
Set Variable [ $r; Value:MBS( "AVAsset.Release"; $Asset ) ]
Show Custom Dialog [ "Failed to create export sessio..."; MBS("Text.RemovePrefix"; $$AVExport; " [ MBS
] ") ]
Exit Script [ ]
End If
Set Variable [ $r; Value:MBS( "AVAsset.Release"; $Asset ) ]
Set Field [ AVAsset Export Session::Duration; MBS( "AVExport.Duration"; $$AVExport ) ]
Set Field [ AVAsset Export Session::SupportedFileTypes; MBS( "AVExport.SupportedFileTypes"; $$AVExport ) ]

```

Example Databases

- [Mac only/Movies/AVAsset Export Session](#)

Created 29th February 2016, last changed 1st March 2016.

39.8 AVExport.ExportSessionMerge

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.2	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.ExportSessionMerge"; AssetList; Preset)

Parameters

AssetList

A list of assets. Can contain reference numbers for assets obtained from AVAsset.OpenContainer, AVAsset.OpenFile or AVAsset.OpenURL. Or file paths to assets. (or a combination of both types)

"54001§54002§54003"

Preset

The preset name to use. Can be one of the presets returned by AVExport.AllExportPresets or one of the predefined ones:

"640x480"

Result Returns reference number or error.

Description

Returns a reference number for the new AVAsset export session for the specified source assets and preset. The given assets are joined and exported together as one movie. They should match in size/type.

Same as AVExport.ExportSession, but takes a list of AVAssets.

Examples

Export three videos:

```
MBS( "AVExport.ExportSessionMerge"; "/Users/cs/Movies/test1.m4v§/Users/cs/Movies/test2.m4v§/Users/cs/Movies/test3.m4v"; AVAsset Export Session::PresetName )
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.GetOutputFileType"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns text or error.

Description

Indicates the type of file to be written by the session.

See also

- 39.18 AVExport.SetOutputFileType

39.12 AVExport.GetShouldOptimizeForNetworkUse

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.GetShouldOptimizeForNetworkUse"; AVExportSession)

Parameters**AVExportSession**

The session reference number.

\$AVExport

Result Returns 1, 0 or error.

Description

Indicates that the output file should be optimized for network use, e.g. that a QuickTime movie file should support "fast start".

Returns 1 when optimization is enabled.

See also

- 39.21 AVExport.SetShouldOptimizeForNetworkUse

1053

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.GetTimeRange"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns value or error.

Description

Result is returned a start time, §and duration, e.g. "60§180" for start after one minute and duration of 3 minutes.

See also

- 39.22 AVExport.SetTimeRange

1054

Created 29th February 2016, last changed 29th February 2016.

39.14 AVExport.OutputFileExtension

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.OutputFileExtension"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns text or error.

Description

Please set file type first via AVExport.SetOutputFileType.

Examples

Export to desktop folder:

```
Set Field [ AVAsset Export Session::Output File Path; MBS("Path.AddPathComponent"; MBS("Folders.UserDesktop"); "test." & AVAsset Export Session::OutputFileExtension) ]
```

```
Set Variable [ $r; Value:MBS( "AVExport.SetOutputPath"; $$AVExport; AVAsset Export Session::Output File Path) ]
```

Set output file type and query default file extension:

```
Set Variable [ $r; Value:MBS( "AVExport.SetOutputFileType"; $$AVExport; AVAsset Export Session::OutputFileType ) ]
```

```
Set Field [ AVAsset Export Session::OutputFileExtension; MBS( "AVExport.OutputFileExtension"; $$AVExport ) ]
```

Created 29th February 2016, last changed 1st March 2016.

39.15 AVExport.PresetName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.PresetName"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns text or error.

Description

Indicates the name of the preset with which the AVExportSession was initialized.

Created 29th February 2016, last changed 29th February 2016.

39.16 AVExport.Progress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.Progress"; AVExportSession)

Parameters**AVExportSession**

The session reference number.

\$AVExport

Result Returns value or error.

Description

The progress of the export on a scale from 0 to 1.0.

A value of 0 means the export has not yet begun, A value of 1.0 means the export is complete.

39.17 AVExport.Release

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.Release"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns OK or error.

Description

All memory is released.

Please call this when you are done with the export.

Examples

Release export session:

```
Set Variable [ $r; Value:MBS("AVExport.Release"; $$AVExport) ]
```

```
Set Variable [ $$AVExport; Value:"" ]
```

Created 29th February 2016, last changed 1st March 2016.

39.18 AVExport.SetOutputFileType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.SetOutputFileType"; AVExportSession; FileType)

Parameters**AVExportSession**

The session reference number.

\$AVExport

FileType

The new file type.

"com.apple.quicktime-movie"

Result Returns OK or error.

Description

Indicates the type of file to be written by the session.

The value of this property must be set before you invoke `AVExport.ExportAsynchronously`; otherwise `AVExport.ExportAsynchronously` will return an error.

Setting the value of this property to a file type that's not among the session's supported file types will result in an error. See `AVExport.SupportedFileTypes`.

Examples

Set output file type and query default file extension:

```
Set Variable [ $r; Value:MBS( "AVExport.SetOutputFileType"; $$AVExport; AVAsset Export Session::OutputFileType ) ]
```

```
Set Field [ AVAsset Export Session::OutputFileExtension; MBS( "AVExport.OutputFileExtension"; $$AVExport ) ]
```

Created 29th February 2016, last changed 1st March 2016.

39.19 AVExport.SetOutputPath

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.SetOutputPath"; AVExportSession; Path)

Parameters

AVExportSession

The session reference number.

\$AVExport

Path

The new native file path.

"/Users/cs/Desktop/test.mov"

Result Returns OK or error.

Description

Indicates the native file path of the export session's output. You may use AVExport.OutputFileExtension to obtain an appropriate path extension for the outputFileType you have specified.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Export to desktop folder:

```
Set Field [ AVAsset Export Session::Output File Path; MBS("Path.AddPathComponent"; MBS("Folders.UserDesktop"); "test." & AVAsset Export Session::OutputFileExtension) ]
```

```
Set Variable [ $r; Value:MBS( "AVExport.SetOutputPath"; $$AVExport; AVAsset Export Session::Output File Path) ]
```

39.20 AVExport.SetOutputURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.SetOutputURL"; AVExportSession; URL)

Parameters

AVExportSession

The session reference number.

\$AVExport

URL

The new output URL.

Result Returns text or error.

Description

Indicates the URL of the export session's output. You may use AVExport.OutputFileExtension to obtain an appropriate path extension for the outputFileType you have specified.

See also

- 39.10 AVExport.GetOutputPath 1041
- 39.11 AVExport.GetOutputURL 1042

Created 29th February 2016, last changed 1st March 2016.

39.21 AVExport.SetShouldOptimizeForNetworkUse

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.SetShouldOptimizeForNetworkUse"; AVExportSession; Setting)

Parameters**AVExportSession**

The session reference number.

\$AVExport

Setting

Pass 1 to enable optimization or 0 to disable.

1

Result Returns OK or error.

Description

Indicates that the output file should be optimized for network use, e.g. that a QuickTime movie file should support "fast start".

See also

- 39.12 AVExport.GetShouldOptimizeForNetworkUse

1043

Created 29th February 2016, last changed 29th February 2016.

39.22 AVExport.SetTimeRange

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.SetTimeRange"; AVExportSession; StartTime; Duration)

Parameters

AVExportSession

The session reference number.

\$AVExport

StartTime

Start time in seconds from beginning.

0

Duration

The duration of the video section to export in seconds.

5*60

Result Returns OK or error.

Description

The default timeRange of an export session is all, meaning that the full duration of the asset will be exported.

See also

- 39.13 AVExport.GetTimeRange

1044

Created 29th February 2016, last changed 29th February 2016.

39.23 AVExport.Status

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.Status"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns text or error.

Description

Can be Unknown, Waiting, Exporting, Completed, Failed or Cancelled.

Examples

Check Status:

```

If [ IsEmpty($$AVExport) ]
Set Field [ AVAsset Export Session::Progress; "" ]
Set Field [ AVAsset Export Session::Error; "" ]
Set Field [ AVAsset Export Session::Status; "" ]
Else
Set Field [ AVAsset Export Session::Progress; MBS( "AVExport.Progress"; $$AVExport ) ]
Set Field [ AVAsset Export Session::Error; MBS( "AVExport.Error"; $$AVExport ) ]
Set Field [ AVAsset Export Session::Status; MBS( "AVExport.Status"; $$AVExport ) ]
End If
If [ AVAsset Export Session::Status = "Completed" or AVAsset Export Session::Status = "Failed" ]
Install OnTimer Script [ ]
End If

```

Created 29th February 2016, last changed 1st March 2016.

39.24 AVExport.SupportedFileTypes

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
39 AVExport	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("AVExport.SupportedFileTypes"; AVExportSession)

Parameters

AVExportSession

The session reference number.

\$AVExport

Result Returns list or error.

Description

Indicates the types of files the target can write, according to the preset the target was initialized with.

Does not perform an inspection of the AVAsset to determine whether its contents are compatible with the supported file types.

Examples

Query supported file types:

```
Set Field [ AVAsset Export Session::SupportedFileTypes; MBS( "AVExport.SupportedFileTypes"; $$AVExport ) ]
```

Chapter 40

AVPlayer

Play audio on Mac and iOS.

Play audio in background while doing work in FileMaker.

See also WMFP functions for Windows.

40.1 AVPlayer.FindPlayers

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.3	Yes	No	No	No	Yes

MBS("AVPlayer.FindPlayers")

Result Returns list of identifiers or error.

Description

Looks for interactive containers using AVPlayer for playback and returns new identifiers for them. We added this function to query time of a playing interactive container on iOS.

Seems to work on Mac for FileMaker 16, too.

Looks on the current window with focus.

Examples

Query time of container playing container on iOS:

```
# find players
Set Variable [ $list; MBS( "AVPlayer.FindPlayers" ) ]
# pick first one
Set Variable [ $player; GetValue($list; 1) ]
# query time
Set Variable [ $time; MBS( "AVPlayer.GetTime"; AVPlayer ) ]
```

40.8 AVPlayer.GetProgressEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.4	Yes	No	No	No	Yes

MBS("AVPlayer.GetProgressEvaluate"; AVPlayer)

Parameters

AVPlayer

The reference number of the player.

\$Player

Result Returns OK or error.

Description

See also

40.10 AVPlayer.GetRate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.GetRate"; AVPlayer)

Parameters

AVPlayer

The reference number of the player.

\$Player

Result Returns value or error.

Description

Rate is 1.0 by default.

You for example can use 0.5 to play half speed or 2.0 for double speed.

40.11 AVPlayer.GetTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.GetTime"; AVPlayer)

Parameters

AVPlayer

The reference number of the player.

\$Player

Result Returns value or error.

Description

Examples

Query time of container playing container on iOS:

```
# find players
Set Variable [ $list; MBS( "AVPlayer.FindPlayers" ) ]
# pick first one
Set Variable [ $player; GetValue($list; 1) ]
# query time
Set Variable [ $time; MBS( "AVPlayer.GetTime"; AVPlayer ) ]
```

40.13 AVPlayer.OpenContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.OpenContainer"; Container)

Parameters

Container

The container with the audio file.

MyTable::MovieContainer

Result Returns player reference number or error.

Description

Returns the movie reference which must be released with AVPlayer.Release function. See also AVPlayer.OpenFile or AVPlayer.OpenURL.

Works with normal container, compressed container and referenced container file.

Examples

Open from container:

```
Set Variable [ $player; Value:MBS("AVPlayer.OpenContainer"; AVPlayer::Container) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error loading audio file."; $player ]
Exit Script [ ]
End If
Set Field [ AVPlayer::Duration; MBS("AVPlayer.GetDuration"; $player) ]
Set Field [ AVPlayer::Rate; MBS("AVPlayer.GetRate"; $$Player) ]
Set Field [ AVPlayer::Volume; MBS("AVPlayer.GetVolume"; $$Player) ]
Set Variable [ $$player; Value:$player ]
```

40.14 AVPlayer.OpenFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.OpenFile"; Path)

Parameters

Path

The native file path to the movie file.

"/Test.mov"

Result Returns player reference number or error.

Description

Returns the reference number which must be released with AVPlayer.Release function.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

Examples

Open file:

```
Set Variable [ $player; Value:MBS("AVPlayer.OpenFile"; AVPlayer::FilePath) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error loading audio file."; $player ]
Exit Script [ ]
End If
Set Field [ AVPlayer::Duration; MBS("AVPlayer.GetDuration"; $player) ]
Set Field [ AVPlayer::Rate; MBS("AVPlayer.GetRate"; $$Player) ]
Set Field [ AVPlayer::Volume; MBS("AVPlayer.GetVolume"; $$Player) ]
Set Variable [ $$player; Value:$player ]
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.OpenURL"; URL)

Parameters

URL

The URL of the audio file to open.
"http://example.test/mysound.mp3"

Result Returns player reference number or error.

Description

Returns the player reference number which must be released with AVPlayer.Release function.

See also

40.16 AVPlayer.Pause

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.Pause"; AVPlayer)

Parameters

AVPlayer

The reference number of the player.

\$Player

Result Returns OK or error.

Description

Examples

Pause player:

```
If [ Length($$Player)>0 ]
Set Variable [ $r; Value:MBS("AVPlayer.Pause"; $$Player) ]
Else
Show Custom Dialog [ "Please open Movie first!" ]
End If
```

40.17 AVPlayer.Play

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.Play"; AVPlayer)

Parameters

AVPlayer

The reference number of the player.

\$Player

Result Returns OK or error.

Description

Examples

Play audio:

```
If [ $$Player "" ]
Set Variable [ $r; Value:MBS("AVPlayer.Play"; $$Player) ]
Else
Show Custom Dialog [ "Please open Movie first!" ]
End If
```

Play with progress:

```
If [ $$Player "" ]
# set progress callback
Set Variable [ $r ; Value: MBS("AVPlayer.SetProgressEvaluate"; $$Player; "MBS(\ "FM.ExecuteFileSQL\ ";
\ "AVPlayer.fmp12\ "; \ "UPDATE \\\ "AVPlayer\\\ " SET \\\ "Position\\\ "=?\ "; 9; 13; $$Time$$ / 1000)" )
]
Set Variable [ $r ; Value: MBS("AVPlayer.SetProgressInterval"; $$Player; 1) ]
# now plays
Set Variable [ $r ; Value: MBS("AVPlayer.Play"; $$Player) ]
# commit. SQL can't update if record is edited.
Commit Records/Requests [ With dialog: Off ]
# Trigger script when sound is done.
Set Variable [ $r ; Value: MBS("AVPlayer.SetFinishedScript"; $$Player; Get(FileName); "Played") ]
Else
Show Custom Dialog [ "Please open Movie first!" ]
End If
```

40.18 AVPlayer.Release

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.Release"; AVPlayer)

Parameters

AVPlayer

The reference number of the player.

\$Player

Result Returns OK or error.

Description

If you forget to release a player, the audio object stays in memory and if memory is low, FileMaker will crash.

To avoid this the plugin will only open up to 50 files simultaneously.

Examples

Release player:

```
# Close last movie if it was open.
If [ Length($$Player)>0 ]
Set Variable [ $r; Value:MBS("AVPlayer.Release"; $$Player) ]
Set Variable [ $$Player; Value:"" ]
End If
```

40.20 AVPlayer.SetFinishedEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.4	Yes	No	No	No	Yes

MBS("AVPlayer.SetFinishedEvaluate"; AVPlayer; Expression)

Parameters

AVPlayer

The reference number of the player.

\$Player

Expression

The expression to evaluate. Can be in local language of FileMaker Pro or english. For Server must always be in english.

"Let (\$\$Done = 1 ; 1)"

Result Returns OK or error.

Description

In the expression the text \$\$ID\$\$ will be replaced when evaluated with the curl reference, so you can pass it to other functions if needed.

Examples

Sets evaluate for when player finished to show dialog:

```
Set Variable [ $r ; Value: MBS("AVPlayer.SetFinishedEvaluate"; $Player; "MBS( \Msgbox\"; \Player done.\") ) ]
```

- [MBS FileMaker Plugin, version 7.4pr5](#)

Created 6th September 2017, last changed 24th January 2019.

40.21 AVPlayer.SetFinishedScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.4	Yes	No	No	No	Yes

MBS("AVPlayer.SetFinishedScript"; AVPlayer; Filename; ScriptName)

Parameters

AVPlayer

The reference number of the player.

\$Player

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

With plugin version 6.0 or newer the script name can be a script ID number. In that case the plugin queries the script name for the given script ID. This allows to call scripts by ID and avoid problems if scripts are later renamed.

Examples

Set finished script:

```
Set Variable [ $r ; Value: MBS("AVPlayer.SetFinishedScript"; $$Player; Get(FileName); "Played") ]
```

See also

40.22 AVPlayer.SetMuted

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.SetMuted"; AVPlayer; State)

Parameters

AVPlayer

The reference number of the player.

\$Player

State

The new mute state.

1

Result Returns OK or error.

Description

Pass 1 to mute or 0 to unmute.

See also

40.23 AVPlayer.SetProgressEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.4	Yes	No	No	No	Yes

MBS("AVPlayer.SetProgressEvaluate"; AVPlayer; Expression)

Parameters

AVPlayer

The reference number of the player.

\$Player

Expression

The expression to evaluate. Can be in local language of FileMaker Pro or english. For Server must always be in english.

Result Returns OK or error.

Description

Evaluated once as second to update progress in GUI.

In the expression the text \$\$ID\$\$ will be replaced when evaluated with the curl reference, so you can pass it to other functions if needed. \$\$Time\$\$ is replaced with current time in milliseconds.

Examples

Play and define progress expression:

```
Set Variable [ $r ; Value: MBS("AVPlayer.SetProgressEvaluate"; $$Player; "MBS(\ "FM.ExecuteFileSQL\"; \ "AVPlayer.fmp12\"; \ "UPDATE \\\ "AVPlayer\\\ " SET \\\ "Position\\\ "=?\"; 9; 13; $$Time$$ / 1000)") ]
```

```
Set Variable [ $r ; Value: MBS("AVPlayer.SetProgressInterval"; $$Player; 1) ]
```

```
Set Variable [ $r ; Value: MBS("AVPlayer.Play"; $$Player) ]
```

40.24 AVPlayer.SetProgressInterval

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.4	Yes	No	No	No	Yes

MBS("AVPlayer.SetProgressInterval"; AVPlayer; Time)

Parameters

AVPlayer

The reference number of the player.

\$Player

Time

The time interval to use.

5

Result Returns OK or error.

Description

Using interval <1.0 can be a problem because FileMaker would evaluate only and not do anything else.

Examples

Play and define progress expression:

```
Set Variable [ $r ; Value: MBS("AVPlayer.SetProgressEvaluate"; $$Player; "MBS(\ "FM.ExecuteFileSQL\ ";
\ "AVPlayer.fmp12\ "; \ "UPDATE \\\ "AVPlayer\\\ " SET \\\ "Position\\\ "=?\ "; 9; 13; $$Time$$ / 1000)" )
]
Set Variable [ $r ; Value: MBS("AVPlayer.SetProgressInterval"; $$Player; 1) ]
Set Variable [ $r ; Value: MBS("AVPlayer.Play"; $$Player) ]
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.SetRate"; AVPlayer; Rate)

Parameters

AVPlayer

The reference number of the player.

\$Player

Rate

The new rate.

1.0

Result Returns OK or error.

Description

Default is 1.0.

You can for example set to 0.5 for half speed or 2.0 for double speed.

Examples

Sets rate:

```
Set Variable [ $r; Value:MBS("AVPlayer.SetRate"; $$Player; AVPlayer::Rate) ]
```

```

40.27 AVPlayer.SetVolume

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
40 AVPlayer	7.1	Yes	No	No	No	Yes

MBS("AVPlayer.SetVolume"; AVPlayer; Volume)

Parameters

AVPlayer

The reference number of the player.

\$Player

Volume

The new volume. Zero is no volume like muted.

1.0

Result Returns OK or error.

Description

Default is 1.0. You can for example set to 0.5 for half volume.

Examples

Sets volume:

```
Set Variable [ $r; Value:MBS("AVPlayer.SetVolume"; $$Player; AVPlayer::Volume) ]
```

```
Set Field [ AVPlayer::Volume; MBS("AVPlayer.GetVolume"; $$Player) ]

Chapter 41

AVRecorder

Audio and video recording

Functions to record audio and/or video files.

41.1 AVRecorder.AddPreviewToWindow

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.AddPreviewToWindow"; AVSession; WindowRef; X; Y; W; H { ; Rotation })

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

WindowRef

Window Reference is the unique OS level window ID. You can obtain this by using the Window.FindByTitle or Window.FindByIndex functions. Pass zero to access the frontmost window.

0

X

The x coordinate.

20

Y

The y coordinate

200

W

The width of the preview area.

320

H

The height of the preview area.

200

Rotation

Optional

Available in MBS FileMaker Plugin 8.1 or newer.

Rotation of image display. Mac only. e.g. pass in 90 or -90 to rotate by 90 or -90 degree.

0

Result Returns OK or error.

Description**Examples**

Start preview:

```
Set Variable [ $r; Value:MBS("AVRecorder.AddPreviewToWindow"; $Session; Get(WindowName); 50; 200; 320; 240) ]
```

```
Set Variable [ $r; Value:MBS("AVRecorder.StartPreview"; $Session) ]
```

41.3 AVRecorder.AudioDeviceInfo

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.AudioDeviceInfo"; AVSession; Index; Selector)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Index

The index of the device from 0 to AVRecorder.AudioDeviceCount-1 or the name or ID of the device.

0

Selector

Which value to return. Can be ID, Name, Description, Index. On Mac can also be manufacturer, modelID, transportType, connected, inUseByAnotherApplication or suspended.

"Name"

Result Returns value or error.

Description

Examples

Enumerate audio devices:

```
# list audio devices
Set Variable [ $count; Value:MBS("AVRecorder.AudioDeviceCount"; $recorder) ]
If [ $count >0 ]
Set Variable [ $index; Value:0 ]
Loop
# next
New Record/Request
Set Field [ AVRecorder Devices::Index; $index ]
Set Field [ AVRecorder Devices::ID; MBS("AVRecorder.AudioDeviceInfo"; $recorder; $index; "ID") ]

41.4 AVRecorder.AuthorizationStatusForMediaType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	8.4	Yes	No	No	No	Yes

MBS("AVRecorder.AuthorizationStatusForMediaType"; MediaType)

Parameters

MediaType

The media type, can be video or audio.

"video"

Result Returns status or error.

Description

Returns the client's authorization status for accessing the underlying hardware that supports a given media type.

The possible values are:

NotDetermined	Indicates that the user has not yet made a choice regarding whether the client can access the hardware.
Restricted	The client is not authorized to access the hardware for the media type. The user cannot change the client's status, possibly due to active restrictions such as parental controls being in place.
Denied	The user explicitly denied access to the hardware supporting a media type for the client.
Authorized	The client is authorized to access the hardware supporting a media type.

41.5 AVRecorder.CaptureStillPhoto

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.2	Yes	Yes	No	No	Yes

MBS("AVRecorder.CaptureStillPhoto"; AVSession { ; FileName })

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.
\$AVSession

FileName

Optional

The file name for the jpeg image.
"still.jpg"

Result Returns image or error.

Description

The image is returned a JPEG image as container value on Mac and BMP on Windows.
Added Windows support with plugin version 6.5.
May require running the preview as we capture only current preview frame on Windows.

If you need content detection, you can always get current frame with AVRecorder.CaptureStillPhoto and pass it to OCR.SetImage for text recognition or Barcode.Detect to find different barcodes.

Examples

Init and Capture photo:

```
# Start session
Set Variable [ $capture; Value:MBS( "AVRecorder.Init" ) ]
# Pick first video device
Set Variable [ $r; Value:MBS( "AVRecorder.SetVideoDevice"; $capture; 0 ) ]
# Start preview
Set Variable [ $r; Value:MBS("AVRecorder.StartPreview"; $capture) ]
# Wait a bit to have camera get up and running
Pause/Resume Script [ Duration (seconds): .5 ]
# Take a picture
Set Variable [ $r; Value:MBS( "AVRecorder.CaptureStillPhoto"; $capture ) ]
# Put in container
Set Field [ test::Test; $r ]
# Cleanup
Set Variable [ $r; Value:MBS( "AVRecorder.Release"; $capture ) ]
```

41.6 AVRecorder.ClosePreview

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.ClosePreview"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns OK or error.

Description

Examples

Close preview:

MBS("AVRecorder.ClosePreview"; \$AVSession)

See also

41.7 AVRecorder.CurrentQRCode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	8.4	Yes	No	No	No	Yes

MBS("AVRecorder.CurrentQRCode"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns text or error.

Description

If you query this, a flag is cleared, which will start again the trigger to call script if new code is detected.

Returns empty if no QRCode is detected.

Examples

Update field with current code:

```
Set Field [ AVRecorder::Barcode ; MBS("AVRecorder.CurrentQRCode"; AVRecorder::Session) ]
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	9.1	No	Yes	No	No	No

MBS("AVRecorder.EncoderInfo"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns OK or error.

Description

Windows 10 includes usually the following encoders for video: WMVideo8 Encoder DMO, WMVideo9 Encoder DMO, MSScreen 9 encoder DMO, DV Video Encoder, MJPEG Compressor.

41.11 AVRecorder.GetAutomaticallyAdjustsVideoMirroring

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	7.4	Yes	No	No	No	Yes

MBS("AVRecorder.GetAutomaticallyAdjustsVideoMirroring"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns 1, 0 or error.

Description

For some session configurations, video data flowing through the connection will be mirrored by default. When the value of this property is 1, the value of videoMirrored may change depending on the configuration of the session, for example after switching to a different device input. The default value is 1.

41.17 AVRecorder.Init

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.Init")

Result Returns OK or error.

Description

You need to call init to get a new session ID which is needed for all other AVRecorder calls. Please call AVRecorder.Release when you are done with recording.

Examples

Enumerate audio and video devices:

```
# init
Set Variable [ $recorder; Value:MBS("AVRecorder.Init") ]
Delete All Records [ No dialog ]
# audio
Set Variable [ $count; Value:MBS("AVRecorder.AudioDeviceCount"; $recorder) ]
If [ $count >0 ]
Set Variable [ $index; Value:0 ]
Loop
# next
New Record/Request
Set Field [ AVRecorder Devices::Index; $index ]

41.21 AVRecorder.RequestAccessForMediaType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	8.4	Yes	No	No	No	Yes

MBS("AVRecorder.RequestAccessForMediaType"; MediaType)

Parameters

MediaType

The media type, can be video or audio.

"video"

Result Returns OK or error.

Description

Requests access to the underlying hardware for the media type, showing a dialog to the user if necessary.

May show a dialog to user, so call early when the features are needed.

Check with AVRecorder.AuthorizationStatusForMediaType, whether you are allowed.

See also

41.22 AVRecorder.SetAudioDevice

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.SetAudioDevice"; AVSession; Device)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Device

The device name, ID or index.

0

Result Returns OK or error.

Description

Examples

Sets first audio device:

```
Set Variable [ $r; Value:MBS("AVRecorder.SetAudioDevice"; AVRecorder::Session; 0) ]
```

Use audio device with name "Built-in Microphone":

```
Set Variable [ $r; Value:MBS("AVRecorder.SetAudioDevice"; AVRecorder::Session; "Built-in Microphone") ]
```

41.23 AVRecorder.SetAutomaticallyAdjustsVideoMirroring

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	7.4	Yes	No	No	No	Yes

MBS("AVRecorder.SetAutomaticallyAdjustsVideoMirroring"; AVSession; Mode)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Mode

The new mode. Pass 1 to allow automatical mirroring or 0 to not mirror.

0

Result Returns OK or error.

Description

Examples

Turn on mirroring:

```
# disable auto mirror
```

```
Set Variable [ $r ; Value: MBS( "AVRecorder.SetAutomaticallyAdjustsVideoMirroring"; $AVSession; 0 ) ]
```

```
# enable mirror manually
```

```
Set Variable [ $r ; Value: MBS( "AVRecorder.SetVideoMirrored"; $AVSession; 1 ) ]
```

41.24 AVRecorder.SetEncoder

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	9.1	No	Yes	No	No	No

MBS("AVRecorder.SetEncoder"; AVSession; Encoder)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Encoder

The encoder name, ID or index.

0

Result Returns OK or error.

Description

Not all combinations of video source, encoder and destination file will work. AVRecorder.StartRecording may fail later.

On Mac and iOS we use standard encoder by default (H264 usually).

Examples

Set encoder:

```
MBS( "AVRecorder.SetEncoder"; $AVSession; "WMVideo9 Encoder DMO" )
```

Set DV encoder:

```
MBS("AVRecorder.SetEncoder"; AVRecorder::Session; "DV Video Encoder")
```

41.25 AVRecorder.SetFilePath

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.SetFilePath"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns OK or error.

Description

Please use a native path with .avi (Windows) or .m4v (Mac) for recording.

For Mac with audio only you can also use .m4a as extension.

Examples

Sets a file path:

```

If [ MBS("SystemInfo.isMacOSX") ]
Set Field [ AVRecorder::FilePath; MBS( "Folders.UserDesktop" ) & "/test.m4v" ]
Else
Set Field [ AVRecorder::FilePath; MBS( "Folders.UserDesktop" ) & "\test.avi" ]
End If
Set Variable [ $r; Value:MBS("AVRecorder.SetFilePath"; AVRecorder::Session; AVRecorder::FilePath) ]

```

41.26 AVRecorder.SetScreenInput

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	8.4	Yes	No	No	No	No

MBS("AVRecorder.SetScreenInput"; AVSession { ; DisplayIndex; capturesCursor; capturesMouseClicks; cropRectLeft; cropRectBottom; cropRectWidth; cropRectHeight })

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

DisplayIndex

Optional

The index of the screen. Derfault is zero for main screen.

0

capturesCursor

Optional

Whether the cursor should be rendered to the captured output. By default, screen input draws the cursor in its captured output. If this parameter is zero, the captured output contains only the windows on the screen. Cursor is omitted. Note that cursor position and mouse button state at the time of capture is preserved in CMSampleBuffers emitted from screen input.

1

capturesMouseClicks

Optional

Whether mouse clicks should be highlighted in the captured output. By default, screen input does not highlight mouse clicks in its captured output. If this parameter is 1, mouse clicks are highlighted (a circle is drawn around the mouse for the duration of the click) in the captured output.

1

cropRectLeft

Optional

cropRectBottom

Optional

cropRectWidth

Optional

cropRectHeight

Optional

Result Returns OK or error.

Description

cropRectLeft, cropRectBottom, cropRectWidth, cropRectHeight indicate the bounding rectangle of the screen area to be captured in pixels.

Screen input captures the entire area of the display with which it is associated. To limit the capture rectangle to a subsection of the screen, set the cropRect property, which defines a smaller section of the screen in the screen's coordinate system. The origin (0,0) is the bottom-left corner of the screen.

This function is not available for iOS as AVFoundation framework on iOS has no screen input class.

41.27 AVRecorder.SetVideoDevice

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.SetVideoDevice"; AVSession; Device)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Device

The device name, ID or index.

0

Result Returns OK or error.

Description

Examples

Sets to use first video device:

```
Set Variable [ $r; Value:MBS("AVRecorder.SetVideoDevice"; AVRecorder::Session; 0) ]
```

Use video device with name "FaceTime HD Camera":

```
Set Variable [ $r; Value:MBS("AVRecorder.SetVideoDevice"; AVRecorder::Session; "FaceTime HD Camera") ]
```

41.28 AVRecorder.SetVideoMirrored

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	7.4	Yes	No	No	No	Yes

MBS("AVRecorder.SetVideoMirrored"; AVSession; Mode)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Mode

The new mode. Pass 1 to mirror or 0 to not mirror.

0

Result Returns OK or error.

Description

Examples

Turn on mirroring:

```
# disable auto mirror
```

```
Set Variable [ $r ; Value: MBS( "AVRecorder.SetAutomaticallyAdjustsVideoMirroring"; $AVSession; 0 ) ]
```

```
# enable mirror manually
```

```
Set Variable [ $r ; Value: MBS( "AVRecorder.SetVideoMirrored"; $AVSession; 1 ) ]
```

41.29 AVRecorder.ShowPropertyDialog

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	9.1	No	Yes	No	No	No

MBS("AVRecorder.ShowPropertyDialog"; AVSession; Object { ; WindowRef; X; Y })

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Object

Which object to ask for the dialog. Can be audioDevice, videodevice, encoder, VideoStreamConfig, AudioStreamConfig.

"audioDevice"

WindowRef

Optional

Parent window for dialog. Window Reference is the unique OS level window ID. You can obtain this by using the Window.FindByTitle or Window.FindByIndex functions. Pass zero to access the frontmost window.

0

X

Optional

X position relative to parent window.

Y

Optional

Y position relative to parent window.

Result Returns OK or error.

Description

You can use this function to show standard dialog for video device, audio device, encoder, stream configuration and others. Not all dialogs are supported.

Examples

Show audio properties dialog:

```
MBS( "AVRecorder.ShowPropertyDialog"; AVRecorder::Session; "audioDevice" )
```

Show video properties dialog:

```
MBS( "AVRecorder.ShowPropertyDialog"; AVRecorder::Session; "videoDevice" )
```

Show video stream property dialog:

```
MBS( "AVRecorder.ShowPropertyDialog"; AVRecorder::Session; "VideoStreamConfig")
```

Show encoder options:

```
MBS( "AVRecorder.ShowPropertyDialog"; AVRecorder::Session; "Encoder")
```

41.30 AVRecorder.StartPreview

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.StartPreview"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns OK or error.

Description

Examples

Start preview:

```
Set Variable [ $r; Value:MBS("AVRecorder.AddPreviewToWindow"; $Session; Get(WindowName); 50; 200; 320; 240) ]
```

```
Set Variable [ $r; Value:MBS("AVRecorder.StartPreview"; $Session) ]

41.31 AVRecorder.StartQRCodeDetection

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	8.4	Yes	No	No	No	Yes

MBS("AVRecorder.StartQRCodeDetection"; AVSession { ; Filename; ScriptName })

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.
\$AVSession

Filename

Optional

The database file name where the script is located.
"test.fmp12"

ScriptName

Optional

The script to trigger if a barcode was detected.
"MyScript"

Result Returns OK or error.

Description

Optionally, we can trigger script when a new barcode is detected.
Parameter to the script is the session ID for the recording.

If you need different detection, you can always get current frame with AVRecorder.CaptureStillPhoto and pass it to OCR.SetImage for text recognition or Barcode.Detect to find different barcodes.

Examples

Start QRCode recognition:

```
Set Variable [ $r ; Value: MBS("AVRecorder.StartQRCodeDetection"; AVRecorder::Session; Get(Filename); "GotBarcode") ]
```

41.32 AVRecorder.StartRecording

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.StartRecording"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns OK or error.

Description

Please call AVRecorder.SetFilePath before to define where to put file.

Examples

Start Recording:

```
Set Variable [ $r; Value:MBS("AVRecorder.SetFilePath"; AVRecorder::Session; AVRecorder::FilePath) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $r ]
Exit Script [ ]
End If
Set Variable [ $r; Value:MBS("AVRecorder.StartRecording"; AVRecorder::Session) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $r ]
Exit Script [ ]
End If
```

41.34 AVRecorder.StopRecording

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.StopRecording"; AVSession)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Result Returns OK or error.

Description

Currently on Mac the preview will continue (if enabled) and you can record again.

On Windows it looks like you can only tear down session.

Examples

Stops recording:

```
Set Variable [ $r; Value:MBS("AVRecorder.StopRecording"; $Session) ]
```

41.36 AVRecorder.VideoDeviceInfo

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
41 AVRecorder	6.1	Yes	Yes	No	No	Yes

MBS("AVRecorder.VideoDeviceInfo"; AVSession; Index; Selector)

Parameters

AVSession

The ID for the AVRecorder session as returned by AVRecorder.Init.

\$AVSession

Index

The index of the device from 0 to AVRecorder.VideoDeviceCount-1 or the name or ID of the device.

0

Selector

Which value to return. Can be ID, Name, Description, Index. On Mac can also be manufacturer, modelID, transportType, connected, inUseByAnotherApplication or suspended.

"Name"

Result Returns value or error.

Description

Examples

Enumerate video devices:

```
# list video devices
Set Variable [ $count; Value:MBS("AVRecorder.VideoDeviceCount"; $recorder) ]
If [ $count >0 ]
Set Variable [ $index; Value:0 ]
Loop
# next
New Record/Request
Set Field [ AVRecorder Devices::Index; $index ]

42.2 Backdrop.Install

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
42 Backdrop	2.1	Yes	No	No	No	No

```
MBS( "Backdrop.Install"; Color { ; HideDesktop } )
```

Parameters

Color

The color in RGB separated by comma. Range of color components is from 0 (no color) to 255 (maximum color).

255,0,0

HideDesktop

Optional

Available in MBS FileMaker Plugin 8.2 or newer.

Whether to move window to hide all icons on desktop. Default 0.

0

Description

With 8.2 plugin, you can pass 1 for HideDesktop parameter to move the window just above the desktop icons, so all windows of all apps can be in front of that shield window.

Examples

Install backdrop:

```
MBS("Backdrop.Install"; "255,127,127")
```

Chapter 43

Barcode

Functions for generating and scanning barcodes.

Generate bar code as image, image file or write on PDF page.

43.1 Barcode.Detect

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	3.5	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.Detect"; Image; type { ; ReturnType; TryRotation; Encoding })

Parameters

Image

The image to scan for a barcode. Can be container with image or an Image reference number from our GraphicsMagick image functions.

\$image

type

Which scanner to use. Supported types: Aztec, Codabar, Code39, Code93, Code128, DataMatrix, EAN8, EAN13, ITF, PDF417, QRCode, UPCA and UPCE. Pass All to scan for all types.

"QRCode"

ReturnType

Optional

A boolean to return the type as prefix. Pass 1 if you need prefix. Default is 0 for no prefix.

1

TryRotation

Optional

A boolean value. If 1, the plugin will rotate the image 90° to find vertical barcode. Default is 0.

0

Encoding

Optional

The text encoding for text parameter. Default is native.

UTF8

Result Returns barcode content text or error.**Description**

We use zxing library internally and can only detect what this library handles.

Internally all images are converted to grayscale. For you getting image, it's very important to get a sharp image.

You may need to rotate or crop the image before sending into this method.

Leave some white space around as some decoders don't want to start with black frame on the edge. The barcodes generated with Barcode.Generate often don't read as they have too little resolution (e.g. scale up by 3x) and no white border around (e.g. add 5 pixels).

If special characters or umlauts are not recognized correct, you may have a wrong encoding. Most modern apps use UTF8 for encoding.

For MacOS and iOS, you can also detect barcodes with CoreImage.Detect function.

Examples

Query a QRCode:

```
MBS( "Barcode.Detect"; Images::Image; "QRCode" )
```

43.2 Barcode.DrawBarcode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	3.5	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.DrawBarcode"; PDF; symbology; Text; x; y { ; width; height; Encoding })

Parameters

PDF

The PDF reference returned from DynaPDF.New.

\$pdf

symbology

The symbology to use.

"EANX"

Text

The text to encode in the barcode.

"12345"

x

The x coordinate.

100

y

The y coordinate.

100

width

Optional

The desired width of the barcode in points. Zero gives the auto size.

0

height

Optional

The desired height of the barcode in points. Zero gives the auto size.

0

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

UTF8

Result Returns OK or error.

Description

The plugin uses zint library internally, so we include the zint manual in documentation.

Possible symbologies: CODE11, C25MATRIX, C25INTER, C25IATA, C25LOGIC, C25IND, CODE39, EX-CODE39, EANX, EAN128, CODABAR, CODE128, DPLEIT, DPIDENT, CODE16K, CODE49, CODE93,

FLAT, RSS14, RSSLTD, RSSEXP, TELEPEN, UPCA, UPCE, POSTNET, MSIPLESSEY, FIM, LOGMARS, PHARMA, PZN, PHARMA_TWO, PDF417, PDF417TRUNC, MAXICODE, QRCODE, CODE128B, AUSPOST, AUSREPLY, AUSROUTE, AUSREDIRECT, ISBNX, RM4SCC, DATAMATRIX, EAN14, CODABLOCKF, NVE18, JAPANPOST, KOREAPOST, RSS14STACK, RSS14STACKOMNI, RSSEXPSTACK, PLANET, MICROPDF417, ONECODE, PLESSEY, TELEPEN_NUM, ITF14, KIX, AZTEC, DAFT, MICROQR, HIBC128, HIBC39, HIBCDM, HIBCQR, HIBCPDF, HIBCMICPDF, HIBCLOCKF, HIBCAZTEC, AZRUNE, CODE32, EANXCC, EAN128CC, RSS14CC, RSSLTDCC, RSSEXPCC, UPCACC, UPCECC, RSS14STACKCC, RSS14OMNICC, RSSEXPSTACKCC, CHANNEL, CODEONE, GRIDMATRIX, EANXCHK, UPCACHK, UPCECHK, DOTCODE, HANXIN, VIN, MAILMARK, UPNQR and ULTRA..

For the size, be aware that some types like UPC codes have fixed size depending on content. Please use `DynaPDF.SetPageCoords` to set the coordinate system to `TopDown` before drawing barcodes.

See also `Barcode.SetOptions` for further options.

43.3 Barcode.EANChecksum

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	5.0	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.EANChecksum"; Text)

Parameters

Text

The text with the numbers for the barcode. Do use text and not number, where starting zeros would be skipped.

"12345"

Result The checksum as text.

Description

For EAN 8, please use Barcode.UPCChecksum function.

Examples

Calculates check for EAN:

```
// returns 3 for 12 digit EAN:
MBS( "Barcode.EANChecksum"; "425098421626" )
```

Example result: 3

Calculates EAN checksum for ISBN 978-3-16-148410-0:

```
MBS( "Barcode.EANChecksum"; "978-3-16-148410")
```

Example result: "0"

43.4 Barcode.Generate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	3.5	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.Generate"; symbology; Text { ; width; height; rotation; scale; Transparent; ShowText; Encoding })

Parameters

symbology

The symbology to use. e.g. EANX for EAN-13. Another possibility is to lookup the symbology code in the zint manual and pass the number here. EANX is 13 for example.

"EANX"

Text

The text to encode in the barcode.

"12345"

width

Optional

The desired width of the barcode in pixels. Zero gives the auto size.

0

height

Optional

The desired height of the barcode in pixels. Zero gives the auto size.

0

rotation

Optional

The rotation. Can be 0, 90, 180 or 270.

0

scale

Optional

The scale of the target image. Please use at least 4 for printing the barcode.

1.0

Transparent

Optional

0: black on white 1: black on transparent background 2: white on black (new in 7.2) 3: white on transparent background (new in 7.2)

1

ShowText

Optional

Whether to show text. Use 0 to hide text or 1 to show text.

1

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.
UTF8

Result Returns GImage reference or error.

Description

The plugin uses zint library internally, so we include the zint manual in documentation.

Possible symbologies: CODE11, C25MATRIX, C25INTER, C25IATA, C25LOGIC, C25IND, CODE39, EX-CODE39, EAN8, EANX, EAN128, CODABAR, CODE128, DPLEIT, DPIDENT, CODE16K, CODE49, CODE93, FLAT, RSS14, RSSLTD, RSSEXP, TELEPEN, UPCA, UPCE, POSTNET, MSIPLESSEY, FIM, LOGMARS, PHARMA, PZN, PHARMA_TWO, PDF417, PDF417TRUNC, MAXICODE, QRCODE, CODE128B, AUSPOST, AUSREPLY, AUSROUTE, AUSREDIRECT, ISBNX, RM4SCC, DATAMATRIX, EAN14, CODABLOCKF, NVE18, JAPANPOST, KOREAPOST, RSS14STACK, RSS14STACKOMNI, RSSEXPSTACK, PLANET, MICROPDF417, ONECODE, PLESSEY, TELEPEN_NUM, ITF14, KIX, AZTEC, DAFT, MICRQR, HIBC128, HIBC39, HIBCDM, HIBCQR, HIBCPDF, HIBCMICPDF, HIBCLOCKF, HIBCAZTEC, AZRUNE, CODE32, EANXCC, EAN128CC, RSS14CC, RSSLTDCC, RSSEXPCC, UPCACC, UPCECC, RSS14STACKCC, RSS14OMNICC, RSSEXPSTACKCC, CHANNEL, CODEONE, GRIDMATRIX, EANXCHK, UPCACHK, UPCECHK, DOTCODE, HANXIN, VIN, MAILMARK, UPNQR and ULTRA..

Please use EANX for EAN-2, EAN-5, EAN-8 and EAN-13. You may need to leave away the check digit for some barcodes. EAN-13 can be created with 12 or 13 digits, but for EAN-8, only pas 7 digits.

This function returns an image reference for our GImage functions. There you can either work on the image or simply store it in a container. On the end please free the image with GImage.Release function. For the size, be aware that some types like UPC codes have fixed size depending on content.

See also Barcode.SetOptions for further options.

For MicroQR barcodes, you can use ECC Level 1 to 3, where 1 is default. Length is limited to only 35 characters minus space for ECC.

Examples

Creates UPCA barcode:

```
MBS( "Barcode.Generate"; "UPCA"; "72527270270")
```

Create ISDN 9780271016368 barcode with EAN:

```
MBS( "Barcode.Generate"; "EANX"; "978027101636")
```

Make a barcode and store it as PNG in a container:

```
Set Variable [ $image; Value:MBS( "Barcode.Generate"; "UPCA"; "72527270270") ]
```

```
If [ MBS("Ierror") = 0 ]
```

```
Set Field [ MyTable::BarCodeContainer; MBS( "GImage.WriteToPNGContainer"; $image; "barcode.png"
```

```

) ]
Set Variable [ $r; Value:MBS("GImage.Release"; $image) ]
Else
Set Field [ MyTable::BarCodeContainer; "" ]
End If

```

Generate EAN 128

```
MBS( "Barcode.Generate"; "EAN128"; " [ 00 ] 993262210000005384")
```

Generate UPCA barcode:

```

Set Variable [ $Barcode ; Value: MBS( "Barcode.Generate"; "UPCA"; "76837100000"; 0; 0; 0; 1; 1; 1;
"UTF8" ) ]
If [ MBS( "IsError" ) = 0 ]
Set Field [ test::Barcode ; MBS("GImage.WriteToPNGContainer"; $Barcode; "768371000004.png") ]
Set Variable [ $r ; Value: MBS("GImage.Release"; $Barcode) ]
Else
Set Field [ test::Barcode ; "" ]
End If

```

Create a barcode and change color to red:

```

Set Field [ Barcode Generation::Image; "" ]
Set Variable [ $img; Value:MBS("Barcode.Generate"; Barcode Generation::Symbology; Barcode Genera-
tion::Text) ]
If [ GetAsNumber($img) >0 ]
Set Variable [ $r; Value:MBS("GImage.SetType"; $img; 7) ]
Set Variable [ $r; Value:MBS( "GImage.ReplaceColor"; $img; "black"; "red"; 3) ]
Set Field [ Barcode Generation::Image; MBS( "GImage.WriteToPNGContainer"; $img; "barcode.png") ]
Set Variable [ $r; Value:MBS( "GImage.Release"; $img ) ]
End If

```

Create a data matrix barcode with size 10 and return as container:

```

Let ( [
// set options for Size 10 (32x32) square for data matrix
r = MBS("Barcode.SetOptions"; 0; 10; 100);
// create a data matrix barcode
p = MBS("Barcode.Generate"; "DATAMATRIX"; "12818670,3,1" ; 0; 0; 0; 4);
// success?
e1 = MBS("IsError");
// save as PNG
image = MBS( "GImage.WriteToPNGContainer"; p; "barcode.png" );
// success?
e2 = MBS("IsError");
// free image from memory

```

```
r = MBS("GMImage.Release"; p)
// return container if no error
]; If(e1 = 0 and e2 = 0; image; "") )
```

Generate Maxicode with mode=4:

```
Set Field [ Barcode Generation::Image; "" ]
Set Variable [ $img; Value:MBS("Barcode.SetOptions"; 4) ]
Set Variable [ $img; Value:MBS("Barcode.Generate"; "MAXICODE"; "A MaxiCode Message in Mode 4") ]
If [ MBS("IsError") = 0 ]
Set Field [ Barcode Generation::Image; MBS( "GMImage.WriteToPNGContainer"; $img; "barcode.png") ]
Set Variable [ $r; Value:MBS( "GMImage.Release"; $img ) ]
End If
```

Example for Maxicode creation, e.g. for UPS:

```
Set Variable [ $p ; Value: "LS97TF 826004" // primary text ]
Set Variable [ $t ; Value: " [ ]>{ RS } 01 { GS } 961Z42015596 { GS } UPSN { GS } 123W45 { GS } 339
{ GS } { GS } 1/1 { GS } 1 { GS } N { GS } { GS } LEEDS { GS } { RS } { EOT } " ]
Set Variable [ $t ; Value: Substitute($t; " { EOT } "; Char(4)) ]
Set Variable [ $t ; Value: Substitute($t; " { RS } "; Char(30)) ]
Set Variable [ $t ; Value: Substitute($t; " { GS } "; Char(29)) ]
Set Variable [ $r ; Value: MBS("Barcode.SetOptions"; 3) ]
// Set Variable [ $r ; Value: MBS( "Barcode.SetInputMode"; "data" ) ]
Set Variable [ $r ; Value: MBS( "Barcode.SetInputMode"; "unicode" ) ]
Set Variable [ $r ; Value: MBS("Barcode.SetPrimary"; $p) ]
Set Variable [ $img ; Value: MBS("Barcode.Generate"; "maxicode"; $t) ]
Set Field [ Barcode Generation::Image ; MBS( "GMImage.WriteToPNGContainer"; $img ) ]
Set Variable [ $r ; Value: MBS("GMImage.Release"; $img) ]
```

Create barcode and crop it:

```
Set Field [ Barcode Generation::Image ; "" ]
Set Variable [ $img ; Value: MBS("Barcode.Generate"; Barcode Generation::Symbology; Barcode Genera-
tion::Text) ]
If [ MBS("IsError") = 0 ]
Set Variable [ $ImageHeight ; Value: MBS("GMImage.GetHeight"; $img) ]
Set Variable [ $ImageWidth ; Value: MBS("GMImage.GetWidth"; $img) ]
# calculate the crop rectangle
Set Variable [ $w ; Value: $ImageWidth ]
Set Variable [ $h ; Value: $ImageHeight ]
Set Variable [ $x ; Value: 0 ]
Set Variable [ $y ; Value: $ImageHeight - 50 ]
# crop
Set Variable [ $r ; Value: MBS("GMImage.Crop"; $img; $w & "x" & $h & "+" & $x & "+" & $y) ]
Set Field [ Barcode Generation::Image ; MBS( "GMImage.WriteToPNGContainer"; $img; "barcode.png") ]
Set Variable [ $r ; Value: MBS( "GMImage.Destroy"; $img ) ]
```

End If

Create barcode and cut away top half to get wider EAN codes:

```
Set Field [ Barcode Generation::Image ; "" ]
Set Variable [ $img ; Value: MBS( "Barcode.Generate"; /* Generates a barcode. */ Barcode Generation::Symbology; /* The symbology to use. e.g. EANX for EAN-13. Another possibility is to lookup the symbology code in the zint manual and pass the number here. EANX is 13 for example.e.g.... ]
If [ MBS("IsError") = 0 ]
# crop to top half
Set Variable [ $h ; Value: MBS("GMIImage.GetHeight"; $img) ]
Set Variable [ $w ; Value: MBS("GMIImage.GetWidth"; $img) ]
Set Variable [ $r ; Value: MBS("GMIImage.Crop"; $img; $w & "x" & ($h/2) & "+0+" & ($h/2)) ]
Set Field [ Barcode Generation::Image ; MBS( "GMIImage.WriteToPNGContainer"; $img; "barcode.png") ]
Set Variable [ $r ; Value: MBS( "GMIImage.Destroy"; $img ) ]
End If
```

Create Code39 barcode in Let statement:

```
Let ( [
// create a Code39 barcode
p = MBS("Barcode.Generate"; "CODE39"; $Stock ; 160 ; 25 ; 0 ; 2 ; 1 ; 0);
// success?
e1 = MBS("IsError");
// save as PNG
image = MBS( "GMIImage.WriteToPNGContainer"; p; "barcode.png" );
// success?
e2 = MBS("IsError");
// free image from memory
r = MBS("GMIImage.Release"; p)
// return container if no error
]; If(e1 = 0 and e2 = 0; image; "" )
```

43.5 Barcode.GenerateJSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	9.4	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.GenerateJSON"; JSON)

Parameters

JSON

The JSON block with all options.

```
{ "symbology": "QRCode", "Text": "Hello World", "Scale": 4 }
```

Result Returns GImage reference or error.

Description

All parameters come as values in JSON block and most are optional.

Key	Value	Example
Symbology	Symbol to use. Can be number or text name.	QRCode
Text	Human readable text, which usually consists of input data plus one more check digit.	"Hello World"
Transparent	Transparency mode: 0: black on white, 1: black on transparent background, 2: white on black, 3: white on transparent background	0
Rotation	Rotation angle to use. Multiply of 90°.	0
ShowText	Whether to show text. Pass 0 to hide text.	1
WhitespaceWidth	Whitespace width.	5
BorderWidth	Border width.	5
OutputOptions	Set various output file options as number.	0
Scale	Scale factor for adjusting size of image. Usually 4 or bigger for printing in high resolution.	4
Option1	Symbol specific options.	0
Option2	Symbol specific options.	0
Option3	Symbol specific options.	0
InputMode	Set encoding of input data. Pass 0 for data, 1 for unicode.	1
ECI	Extended Channel Interpretation mode.	3
DotSize	Size of dots used in dotted mode.	1.25
Primary	Primary message data for more complex symbols. ""	
ForegroundColor	Foreground (ink) colour as RGB hexadecimal string. Must be 6 characters.	"ff0000"
BackgroundColor	Background (paper) colour as RGB hexadecimal string. Must be 6 characters.	"0000ff"
OutputFile	Contains the name of the file to output a resulting barcode symbol to. Must end in .png, .gif, .eps, .pcx, .svg or .txt.	"C:\test.png"

Possible symbologies: CODE11, C25MATRIX, C25INTER, C25IATA, C25LOGIC, C25IND, CODE39, EX-CODE39, EAN8, EANX, EAN128, CODABAR, CODE128, DPLEIT, DPIDENT, CODE16K, CODE49, CODE93, FLAT, RSS14, RSSLTD, RSSEXP, TELEPEN, UPCA, UPCE, POSTNET, MSIPLESSEY, FIM, LOGMARS, PHARMA, PZN, PHARMA_TWO, PDF417, PDF417TRUNC, MAXICODE, QRCODE, CODE128B, AUSPOST, AUSREPLY, AUSROUTE, AUSREDIRECT, ISBNX, RM4SCC, DATAMATRIX, EAN14, CODABLOCKF, NVE18, JAPANPOST, KOREAPOST, RSS14STACK, RSS14STACKOMNI, RSSEXPSTACK, PLANET, MICROPDF417, ONECODE, PLESSEY, TELEPEN_NUM, ITF14, KIX, AZTEC, DAFT, MICRQR, HIBC128, HIBC39, HIBCDM, HIBCPDF, HIBCMICPDF, HIBCLOCKF, HIBCAZTEC, AZRUNE, CODE32, EANXCC, EAN128CC, RSS14CC, RSSLTDCC, RSSEXPCC, UPCACC, UPCECC, RSS14STACKCC, RSS14OMNICC, RSSEXPSTACKCC, CHANNEL, CODEONE, GRIDMATRIX, EANXCHK, UPCACHK, UPCECHK, DOTCODE, HANXIN, VIN, MAILMARK, UPNQR and ULTRA..

Please use EANX for EAN-2, EAN-5, EAN-8 and EAN-13. You may need to leave away the check digit for some barcodes. EAN-13 can be created with 12 or 13 digits, but for EAN-8, only pas 7 digits.

This function returns an image reference for our GImage functions. There you can either work on the image or simply store it in a container. On the end please free the image with GImage.Release function. For the size, be aware that some types like UPC codes have fixed size depending on content.

For MicroQR barcodes, you can use ECC Level 1 to 3, where 1 is default. Length is limited to only 35 characters minus space for ECC.

Examples

Create barcode based on JSON:

```
Set Field [ Barcode Generation JSON::Image ; "" ]
Set Variable [ $img ; Value: MBS("Barcode.GenerateJSON"; Barcode Generation JSON::JSON) ]
If [ MBS("IsError") = 0 ]
Set Field [ Barcode Generation JSON::Image ; MBS( "GMImage.WriteToPNGContainer"; $img; "barcode.png" ) ]
Set Variable [ $r ; Value: MBS( "GMImage.Destroy"; $img ) ]
Else
Show Custom Dialog [ "Failed to create barcode" ; $img ]
End If
```

43.6 Barcode.GetInputMode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	8.1	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.GetInputMode")

Result Returns current mode or error.

Description

Value can be data, unicode, GS1, Kanji and SJIS. Empty value for default.

43.7 Barcode.GetOption

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	8.1	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.GetOption"; Index)

Parameters

Index

The index of the option. Can be 1, 2 or 3.

2

Result Returns value or error.

Description

43.9 Barcode.ISBNChecksum

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	5.0	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.ISBNChecksum"; Text)

Parameters

Text

The text with the numbers for the barcode. Do use text and not number, where starting zeros would be skipped.

"12345"

Result The checksum as text.

Description

We have a ISBN 10 and ISBN 13 algorithm depending on how many digits you pass.

Please make sure input has always 10 or 13 digits!

Examples

Calculates checksum for ISBN:

// returns 6 for 9 digit ISBN:

```
MBS( "Barcode.ISBNChecksum"; "074755100" )
```

Example result: 6

Calculates checksum for an ISBN 10:

```
MBS( "Barcode.ISBNChecksum"; "0-306-40615-0" )
```

pass any value for the checksum, if you don't know it.

Example result: "2"

Calculate checksum for a ISBN 13:

```
MBS( "Barcode.ISBNChecksum"; "978-0-306-40615-7" )
```

Example result: "7"

43.11 Barcode.SetInputMode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	8.1	Yes	Yes	Yes	Yes	Yes

```
MBS( "Barcode.SetInputMode"; Mode )
```

Parameters

Mode

The new input mode.

"GS1"

Result Returns OK or error.

Description

Mode can be empty for default.

Values include data, unicode, GS1, Kanji or SJIS.

Examples

Set input mode for ASCII or data:

```
// Uses full ASCII range interpreted as Latin-1 or binary data.
```

```
MBS( "Barcode.SetInputMode"; "Data" )
```

Set input mode for Unicode:

```
// Uses pre-formatted UTF-8 input.
```

```
MBS( "Barcode.SetInputMode"; "Unicode" )
```

Set input mode for GS1:

```
// Encodes GS1 data using FNC1 characters.
```

```
MBS( "Barcode.SetInputMode"; "GS1" )
```

Encode Data Matrix with GS1:

```
Set Field [ Barcode Generation::Image ; "" ]
```

```
Set Variable [ $r ; Value: MBS( "Barcode.SetInputMode"; "GS1" ) ]
```

```
Set Variable [ $img ; Value: MBS("Barcode.Generate"; "DataMatrix"; " [ 01 ] 98898765432106 [ 3202 ] 012345 [ 15 ] 991231" ) ]
```

```
If [ MBS("IsError") = 0 ]
```

```
Set Field [ Barcode Generation::Image ; MBS( "GMImage.WriteToPNGContainer"; $img; "barcode.png" ) ]
```

```
Set Variable [ $r ; Value: MBS( "GMImage.Release"; $img ) ]
```

```
End If
```

43.12 Barcode.SetOption

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	8.1	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.SetOption"; Index; Value)

Parameters

Index

The index of the option. Can be 1, 2 or 3.

2

Value

The new value.

1

Result Returns OK or error.

Description

Index can be 1, 2 or 3.

See Barcode.SetOptions for details.

Examples

Set better ECC level for QRCode:

```
MBS( "Barcode.SetOption"; 1; 3)
```

Set square option for data matrix:

```
MBS( "Barcode.SetOption"; 3; 100 )
```

43.13 Barcode.SetOptions

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	4.3	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.SetOptions" { ; Option1; Option2; Option3 })

Parameters**Option1**

Optional

The first option.

1

Option2

Optional

The second option.

1

Option3

Optional

The third option.

1

Result Returns OK.

Description

Creating a barcode will reset those options to zero for next barcode.

For QRCode:

Option1 is the ECC Level with values from 1 = low, 2 = middle, 3 = better, 4 high. Default is low.

Option2 is version code from 1 to 40. Default is 0 to auto select.

For MicroQR you can use ECC Level 1 to 3 as 4 is not supported.

For Data Matrix:

Option2 size from 1 to 30. 0 is auto. See table in zint manual pdf.

Option3 can be 100 to force square size.

For Code 39:

You can set Option2 to 1 to add module 43 checksum.

For MaxiCode:

Option 1 is the mode.

For PDF 417:

Option 1 is a number between 0 and 8 where the number of codewords used for check information is deter-

mined by $2^{(\text{value} + 1)}$.

Option 2 is the number of columns between 1 and 30.

See also Barcode.DrawBarcode, Barcode.WriteFile and Barcode.Generate.

Examples

Set better ECC level for QRCode:

```
MBS( "Barcode.SetOptions"; 3)
```

Set square option for data matrix:

```
MBS( "Barcode.SetOptions"; 0; 0; 100 )
```

Create QRCode with UTF-8 and size 10:

```
Set Field [ Barcode Generation::Image; "" ]
# Better error correction and size 10
Set Variable [ $r; Value:MBS( "Barcode.SetOptions"; 3; 10 ) ]
# Generate QRCode with UTF-8
Set Variable [ $img; Value:MBS("Barcode.Generate"; "QRCode"; Barcode Generation::Text; 0; 0; 0; 1; 0; 1;
"UTF-8" ) ]
If [ GetAsNumber($img) >0 ]
Set Field [ Barcode Generation::Image; MBS( "GMIImage.WriteToPNGContainer"; $img; "barcode.png" ) ]
Set Variable [ $r; Value:MBS( "GMIImage.Release"; $img ) ]
End If
```

Create a data matrix barcode with size 10 and return as container:

```
Let ( [
// set options for Size 10 (32x32) square for data matrix
r = MBS("Barcode.SetOptions"; 0; 10; 100);
// create a data matrix barcode
p = MBS("Barcode.Generate"; "DATAMATRIX"; "12818670,3,1" ; 0; 0; 0; 4);
// success?
e1 = MBS("IsError");
// save as PNG
image = MBS( "GMIImage.WriteToPNGContainer"; p; "barcode.png" );
// success?
e2 = MBS("IsError");
// free image from memory
r = MBS("GMIImage.Release"; p)
// return container if no error
]; If(e1 = 0 and e2 = 0; image; "" )
```

Create Maxicode with mode 3:

43.13. *BARCODE.SETOPTIONS*

1163

```
Set Variable [ $p ; Value: "196LS97TF826004" // primary text ]
Set Variable [ $t ; Value: "1Z42015596UPSN123W123456/11NLEEDS" // second text ]
Set Variable [ $r ; Value: MBS("Barcode.SetOptions"; 3) ]
Set Variable [ $r ; Value: MBS("Barcode.SetPrimary"; $p) ]
Set Variable [ $img ; Value: MBS("Barcode.Generate"; "maxicode"; $t) ]
```

Created 18th August 2014, last changed 22nd February 2020.

43.14 Barcode.SetPrimary

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	7.1	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.SetPrimary"; Text; Encoding)

Parameters

Text

The text to use.

"Hello World"

Encoding

The text encoding for text parameter. Default is UTF-8.

"UTF-8"

Result Returns OK or error.

Description

Needed for some barcodes like MaxiCode.

For Maxicode, length must be 15 characters. Last 3 characters must be service number as 3 digits. And next three characters before that are the country ID with 3 digits.

Examples

Create Maxicode with Primary text:

```
Set Field [ Barcode Generation::Image; "" ]
Set Variable [ $r; Value:MBS("Barcode.SetOptions"; 4) ]
Set Variable [ $r; Value:MBS("Barcode.SetPrimary"; "999999999840012") ]
Set Variable [ $img; Value:MBS("Barcode.Generate"; "MAXICODE"; "Secondary Message Here") ]
Set Variable [ $r; Value:MBS("Barcode.SetPrimary"; "" ) ]
If [ MBS("IsError") = 0 ]
Set Field [ Barcode Generation::Image; MBS( "GMImage.WriteToPNGContainer"; $img; "barcode.png" ) ]
Set Variable [ $r; Value:MBS( "GMImage.Release"; $img ) ]
End If
```

Create maxicode:

```
Set Field [ Barcode Generation::Image ; "" ]
Set Variable [ $img ; Value: MBS("Barcode.SetOptions"; 2) ]
Set Variable [ $img ; Value: MBS("Barcode.SetPrimary"; "999999999840012"; "utf8") ]
Set Variable [ $img ; Value: MBS("Barcode.Generate"; "Maxicode"; "Secondary Message Here") ]
If [ MBS("IsError") = 0 ]
Set Field [ Barcode Generation::Image ; MBS( "GMImage.WriteToPNGContainer"; $img; "barcode.png" ) ]
Set Variable [ $r ; Value: MBS( "GMImage.Release"; $img ) ]
End If
```

Create Maxicode with mode 3:

```
Set Variable [ $p ; Value: "196LS97TF826004" // primary text ]
Set Variable [ $t ; Value: "1Z42015596UPSN123W123456/11NLEEDS" // second text ]
Set Variable [ $r ; Value: MBS("Barcode.SetOptions"; 3) ]
Set Variable [ $r ; Value: MBS("Barcode.SetPrimary"; $p) ]
Set Variable [ $img ; Value: MBS("Barcode.Generate"; "maxicode"; $t) ]
```

Example for Maxicode creation, e.g. for UPS:

```
Set Variable [ $p ; Value: "LS97TF 826004" // primary text ]
Set Variable [ $t ; Value: " [ ]>{ RS } 01 { GS } 961Z42015596 { GS } UPSN { GS } 123W45 { GS } 339
{ GS } { GS } 1/1 { GS } 1 { GS } N { GS } { GS } LEEDS { GS } { RS } { EOT } " ]
Set Variable [ $t ; Value: Substitute($t; " { EOT } "; Char(4)) ]
Set Variable [ $t ; Value: Substitute($t; " { RS } "; Char(30)) ]
Set Variable [ $t ; Value: Substitute($t; " { GS } "; Char(29)) ]
Set Variable [ $r ; Value: MBS("Barcode.SetOptions"; 3) ]
// Set Variable [ $r ; Value: MBS( "Barcode.SetInputMode"; "data" ) ]
Set Variable [ $r ; Value: MBS( "Barcode.SetInputMode"; "unicode" ) ]
Set Variable [ $r ; Value: MBS("Barcode.SetPrimary"; $p) ]
Set Variable [ $img ; Value: MBS("Barcode.Generate"; "maxicode"; $t) ]
Set Field [ Barcode Generation::Image ; MBS( "GMImage.WriteToPNGContainer"; $img ) ]
Set Variable [ $r ; Value: MBS("GMImage.Release"; $img) ]
```

43.15 Barcode.UPCChecksum

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	3.5	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.UPCChecksum"; Text)

Parameters

Text

The text with the numbers for the barcode. Do use text and not number, where starting zeros would be skipped.

"12345"

Result The checksum as text.

Description

Examples

Calculates a checksum:

MBS("Barcode.UPCChecksum"; "12345")

Calculates 7 for the EAN 5901234123457:

MBS("Barcode.UPCChecksum"; "590123412345")

43.16 Barcode.WriteFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
43 Barcode	4.3	Yes	Yes	Yes	Yes	Yes

MBS("Barcode.WriteFile"; type; path; symbology; Text { ; width; height; rotation; scale; transparent; ShowText; Encoding })

Parameters

type

Which file type to generate. Can be PNG, TIFF, JPEG, SVG or PS.

"SVG"

path

The file path to use. Currently limited to 255 characters for SVG and PS.

"/tmp/test.svg"

symbology

The symbology to use. e.g. EANX for EAN-13.

"EANX"

Text

The text to encode in the barcode.

"12345"

width

Optional

The desired width of the barcode in pixels. Zero gives the auto size.

0

height

Optional

The desired height of the barcode in pixels. Zero gives the auto size.

0

rotation

Optional

The rotation. Can be 0, 90, 180 or 270.

0

scale

Optional

The scale of the target image. Please use at least 4 for printing the barcode.

1.0

transparent

Optional

Pass 1 to have the white background being transparent.

1

ShowText

Optional

Whether to show text. Use 0 to hide text or 1 to show text.

1

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

UTF8

Result Returns OK or error.

Description

The plugin uses zint library internally, so we include the zint manual in documentation.

Possible symbologies: CODE11, C25MATRIX, C25INTER, C25IATA, C25LOGIC, C25IND, CODE39, EX-CODE39, EANX, EAN128, CODABAR, CODE128, DPLEIT, DPIDENT, CODE16K, CODE49, CODE93, FLAT, RSS14, RSSLTD, RSSEXP, TELEPEN, UPCA, UPCE, POSTNET, MSIPLESSEY, FIM, LOGMARS, PHARMA, PZN, PHARMA_TWO, PDF417, PDF417TRUNC, MAXICODE, QRCODE, CODE128B, AUSPOST, AUSREPLY, AUSROUTE, AUSREDIRECT, ISBNX, RM4SCC, DATAMATRIX, EAN14, CODABLOCKF, NVE18, JAPANPOST, KOREAPOST, RSS14STACK, RSS14STACKOMNI, RSSEXPSTACK, PLANET, MICROPDF417, ONECODE, PLESSEY, TELEPEN_NUM, ITF14, KIX, AZTEC, DAFT, MICROQR, HIBC128, HIBC39, HIBCDM, HIBCQR, HIBCPDF, HIBCMICPDF, HIBCLOCKF, HIBCAZTEC, AZRUNE, CODE32, EANXCC, EAN128CC, RSS14CC, RSSLTDCC, RSSEXPCC, UPCACC, UPCECC, RSS14STACKCC, RSS14OMNICC, RSSEXPSTACKCC, CHANNEL, CODEONE, GRIDMATRIX, EANXCHK, UPCACHK, UPCECHK, DOTCODE, HANXIN, VIN, MAILMARK, UPNQR and ULTRA..

Please use EANX for EAN-8 and EAN-13. You may need to leave away the check digit for some barcodes. For the size, be aware that some types like UPC codes have fixed size depending on content.

See also Barcode.SetOptions for further options.

Examples

Creates UPCA barcode:

```
MBS( "Barcode.WriteFile"; "JPEG"; "/tmp/test.jpg"; "UPCA"; "72527270270")
```

Create ISDN 9780271016368 barcode with EAN:

```
MBS( "Barcode.WriteFile"; "SVG"; "/tmp/test.svg"; "EANX"; "978027101636")
```

Creates extended barcode with plus sign:

```
MBS( "Barcode.WriteFile"; "SVG"; "/tmp/test.svg"; "EANX"; "978027101636+90000")
```

Write JPEG file with EAN 128

```
MBS( "Barcode.WriteFile"; "jpg"; "/tmp/test.jpg"; "EAN128"; " [ 01 ] 98898765432106 [ 3202 ] 012345 [ 15
```

43.16. *BARCODE.WRITEFILE* 1169
] 991231”)

Chapter 44

BinaryFile

Read binary data from a file and write it to a file.

44.1 BinaryFile.Append

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Append"; FilePath)

Parameters

FilePath

The native file path. Something like `"/Users/cs/desktop/test.txt"` on Mac and `"C:\Programs\Data\test.txt"` on Windows. Files without path end in the root directory on Mac. `"test.txt"`

Result Returns reference number or error.

Description

See also `Text.AppendTextFile`.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Append text to a file:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Append"; "/Users/cs/Desktop/test.txt" ) ]  
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteText"; $fh; "Hello World" ) ]
```

Set Variable [\$r ; Value: MBS("BinaryFile.Close"; \$fh)]

See also

- 44.21 BinaryFile.WriteText 1199
- 121.2 Path.FileMakerPathToNativePath 6139
- 164.2 Text.AppendTextFile 7769

Created 12nd June 2017, last changed 12nd June 2017.

44.2 BinaryFile.Close

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Close"; BinaryFileRef)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Result Returns OK or error.

Description

Releases memory used for the file.

Examples

Create a file and write Hello:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteText"; $fh; "Hello World" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

- [Tip of the day: Split large files into smaller chunks](#)

Created 12nd June 2017, last changed 12nd June 2017.

44.3 BinaryFile.Create

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Create"; FilePath)

Parameters

FilePath

The native file path. Something like `"/Users/cs/desktop/test.txt"` on Mac and `"C:\Programs\Data\test.txt"` on Windows. Files without path end in the root directory on Mac. `"test.txt"`

Result Returns reference number or error.

Description

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Create a file and write Hello:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteText"; $fh; "Hello World" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

Split files into smaller chunks:

```
Set Variable [ $InputPath ; Value: "/Users/cs/Desktop/test.mp4" ]
Set Variable [ $ChunkSize ; Value: 10*1024*1024 ]
#
Set Variable [ $InputStream ; Value: MBS( "BinaryFile.Open"; $InputPath ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to open file." ; $InputStream & $& $InputPath ]
Exit Script [ Text Result: ]
End If
Set Variable [ $InputLength ; Value: MBS( "BinaryFile.Length"; $InputStream ) ]
Set Variable [ $InputPosition ; Value: 0 ]
Set Variable [ $Counter ; Value: 1 ]
Loop
# Read chunk
Set Variable [ $Chunk ; Value: MBS( "BinaryFile.ReadHex"; $InputStream; $ChunkSize ) ]
#
# Write Chunk
Set Variable [ $OutputPath ; Value: $InputPath & "?" & $Counter ]
Set Variable [ $OutputStream ; Value: MBS( "BinaryFile.Create"; $OutputPath ) ]
If [ MBS("IsError") ]
```

44.3. BINARYFILE.CREATE

1175

```
Show Custom Dialog [ "Failed to create file." ; $InputStream & $OutputPath ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $InputStream ) ]
Exit Script [ Text Result: ]
End If
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteHex"; $OutputStream; $Chunk ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $OutputStream ) ]
#
# next
Set Variable [ $InputPosition ; Value: $InputPosition + $ChunkSize ]
Exit Loop If [ $InputPosition >$InputLength ]
Set Variable [ $Counter ; Value: $Counter +1 ]
End Loop
#
# cleanup
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $InputStream ) ]
```

44.4 BinaryFile.EOF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.EOF"; BinaryFileRef)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Result Returns 1, 0 or error.

Description

Returns 1 if we are at the end or 0 if not.

Examples

Try EOF:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" ) ]
# Check End Of File usage
Set Variable [ $r ; Value: MBS( "BinaryFile.EOF"; $fh ) ]
# Read a lot of data
Set Variable [ $data ; Value: MBS( "BinaryFile.ReadText"; $fh; 10000000; "Latin1" ) ]
# Check End Of File usage
Set Variable [ $r ; Value: MBS( "BinaryFile.EOF"; $fh ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

44.5 BinaryFile.Length

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Length"; BinaryFileRef)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Result Returns number or error.

Description

Examples

Query length:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" ) ]
```

```
Set Variable [ $len ; Value: MBS( "BinaryFile.Length"; $fh ) ]
```

```
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

44.6 BinaryFile.Open

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Open"; FilePath)

Parameters

FilePath

The native file path. Something like `"/Users/cs/desktop/test.txt"` on Mac and `"C:\Programs\Data\test.txt"` on Windows. Files without path end in the root directory on Mac. `"test.txt"`

Result Returns reference number or error.

Description

Examples

Open file:

```
MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" )
```

Split files into smaller chunks:

```
Set Variable [ $InputPath ; Value: "/Users/cs/Desktop/test.mp4" ]
Set Variable [ $ChunkSize ; Value: 10*1024*1024 ]
#
Set Variable [ $InputStream ; Value: MBS( "BinaryFile.Open"; $inputPath ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to open file." ; $InputStream & $& $InputPath ]
Exit Script [ Text Result: ]
End If
Set Variable [ $InputLength ; Value: MBS( "BinaryFile.Length"; $InputStream ) ]
Set Variable [ $InputPosition ; Value: 0 ]
Set Variable [ $Counter ; Value: 1 ]
Loop
# Read chunk
Set Variable [ $Chunk ; Value: MBS( "BinaryFile.ReadHex"; $InputStream; $ChunkSize ) ]
#
# Write Chunk
Set Variable [ $OutputPath ; Value: $InputPath & "." & $Counter ]
Set Variable [ $OutputStream ; Value: MBS( "BinaryFile.Create"; $OutputPath ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to create file." ; $InputStream & $& $OutputPath ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $InputStream ) ]
Exit Script [ Text Result: ]
End If
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteHex"; $OutputStream; $Chunk ) ]
```

44.6. *BINARYFILE.OPEN*

1179

```
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $OutputStream ) ]
#
# next
Set Variable [ $InputPosition ; Value: $InputPosition + $ChunkSize ]

44.7 BinaryFile.Position

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Position"; BinaryFileRef)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Result Returns number or error.

Description

Examples

Play with position:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "~/Users/cs/Desktop/test.txt" ) ]
# Query length
Set Variable [ $len ; Value: MBS( "BinaryFile.Length"; $fh ) ]
# move current position
Set Variable [ $r ; Value: MBS( "BinaryFile.Seek"; $fh; 6 ) ]
# query current position
Set Variable [ $pos ; Value: MBS( "BinaryFile.Position"; $fh ) ]
# read 5 bytes
Set Variable [ $text ; Value: MBS( "BinaryFile.ReadText"; $fh; 5; "UTF8" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

44.8 BinaryFile.ReadByte

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadByte"; BinaryFileRef)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Result Returns value or error.

Description

Returns empty result if reading fails.

See also BinaryFile.WriteByte for writing.

44.9 BinaryFile.ReadContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadContainer"; BinaryFileRef; ByteCount; Filename)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

ByteCount

The number of Bytes to read.

1000

Filename

File name to use for container value. This is used to detect type of container.

"test.pdf"

Result Returns value or error.

Description

Depending on given file name, you get back a PDF, image, video or data container.

See also BinaryFile.WriteContainer for writing.

Examples

Read a JPEG:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.jpg" ) ]
Set Variable [ $len ; Value: MBS("BinaryFile.Length"; $fh) ]
Set Variable [ $image ; Value: MBS( "BinaryFile.ReadContainer"; $fh; $len; "test.jpg" ) ]
Set Field [ test::ContainerField ; $image ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh) ]
```

44.10 BinaryFile.ReadFloat

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadFloat"; BinaryFileRef { ; Bits })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Bits

Optional

The bit width of the value. Pass 32 for a 32-bit floating point number (single) or 64 for a 64-bit floating point number (double). Default is 32.

32

Result Returns value or error.

Description

See also BinaryFile.WriteFloat for writing.

Examples

Read floating point values:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/output.dat" ) ]
Set Variable [ $v1 ; Value: MBS( "BinaryFile.ReadFloat"; $fh; 32) ]
Set Variable [ $v1 ; Value: MBS( "BinaryFile.ReadFloat"; $fh; 64) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh) ]
```

- 44.12 BinaryFile.ReadInt 1186
- 44.13 BinaryFile.ReadPDF 1187
- 44.14 BinaryFile.ReadText 1189
- 44.18 BinaryFile.WriteFloat 1194

Created 12nd June 2017, last changed 12nd June 2017.

44.11 BinaryFile.ReadHex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadHex"; BinaryFileRef; ByteCount)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

ByteCount

The number of Bytes to read.

1000

Result Returns hex text or error.

Description

The read text may be shorter.

Examples

Read hex encoded data:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" ) ]
```

```
Set Variable [ $data ; Value: MBS( "BinaryFile.ReadHex"; $fh; 1000) ]
```

```
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh) ]
```

- **Tip of the day:** [Split large files into smaller chunks](#)

Created 12nd June 2017, last changed 12nd June 2017.

44.12 BinaryFile.ReadInt

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadInt"; BinaryFileRef { ; Bits })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Bits

Optional

The number of bits to use. Can be 8, 16, 32 or 64 bit. Default is 32 bit.

32

Result Returns value or error.

Description

See also BinaryFile.WriteInt for writing.

Examples

Play with reading integers:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $v1 ; Value: MBS( "BinaryFile.ReadInt"; $fh; 8 ) ]
Set Variable [ $v2 ; Value: MBS( "BinaryFile.ReadInt"; $fh; 16 ) ]
Set Variable [ $v3 ; Value: MBS( "BinaryFile.ReadInt"; $fh; 32 ) ]
Set Variable [ $v4 ; Value: MBS( "BinaryFile.ReadInt"; $fh; 64 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

Created 12nd June 2017, last changed 12nd June 2017.

44.13 BinaryFile.ReadPDF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadPDF"; BinaryFileRef; ByteCount { ; Filename })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

ByteCount

The number of Bytes to read.

1000

Filename

Optional

Optional file name to use for PDF in container value.

"test.pdf"

Result Returns PDF, empty or error.

Description

This is a special method which actually reads the data and then looks inside the data for a PDF.

So there can be data before and after the PDF, which is ignored.

Returns nothing if no PDF is found.

For PDF content: If you have a DynaPDF Pro license and DynaPDF functions initialized, this function can add previews for the PDF file on Windows and Linux. For MacOS, we make them with PDFKit.

Examples

Read some PDF from file:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/Tes0059.pdf" ) ]
Set Variable [ $len ; Value: MBS( "BinaryFile.Length"; $fh ) ]
Set Variable [ $pdf ; Value: MBS( "BinaryFile.ReadPDF"; $fh; $len; "test.pdf" ) ]
Set Field [ test::ContainerField ; $pdf ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

44.13.1 Blog Entries

- [MBS FileMaker Plugin, version 9.5pr5](#)

Created 12nd June 2017, last changed 27th October 2019.

44.14 BinaryFile.ReadText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.ReadText"; BinaryFileRef; ByteCount { ; Encoding })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

ByteCount

The number of Bytes to read.

1000

Encoding

Optional

The text encoding for result. Default is native. This function can also handle UTF-16 as well as UTF-16LE and UTF-16BE for little/big endian byte order.

UTF8

Result Returns OK or error.

Description

You have to decide which encoding to use (if not UTF8). We support a few encodings, but we can add more if you need something special. Some characters will be wrong if the encoding is not correct. The read text may be shorter than requested if you hit end of file.

When passing UTF-16 as encoding, we can detect byte order if there is a Byte Order Mark.

See also Text.ReadTextFile and Text.ReadTextFromContainer.

Examples

Read some text:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $len ; Value: MBS("BinaryFile.Length"; $fh) ]
Set Variable [ $text ; Value: MBS( "BinaryFile.ReadText"; $fh; $len; "UTF-8" ) ]
Set Field [ test::ContainerField ; $text ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh) ]
```

44.15 BinaryFile.Seek

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.Seek"; BinaryFileRef; Position)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Position

The new position in the file.

123

Result Returns OK or error.

Description

Examples

Play with Seek:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Open"; "/Users/cs/Desktop/test.txt" ) ]
# Query length
Set Variable [ $len ; Value: MBS( "BinaryFile.Length"; $fh ) ]
# move current position
Set Variable [ $r ; Value: MBS( "BinaryFile.Seek"; $fh; 6 ) ]
# query current position
Set Variable [ $pos ; Value: MBS( "BinaryFile.Position"; $fh ) ]
# read 5 bytes
Set Variable [ $text ; Value: MBS( "BinaryFile.ReadText"; $fh; 5; "UTF8" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

44.16 BinaryFile.WriteByte

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.WriteByte"; BinaryFileRef; Value)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Value

The byte value to write. Range 0 to 255.

123

Result Returns OK or error.

Description

Examples

Write byte:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteByte"; $fh; 65) // 65 is letter A for text files ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh) ]
```

- 44.19 BinaryFile.WriteHex 1195
- 44.20 BinaryFile.WriteInt 1197
- 44.21 BinaryFile.WriteText 1199

Created 12nd June 2017, last changed 12nd June 2017.

44.17 BinaryFile.WriteContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.WriteContainer"; BinaryFileRef; Container)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Container

The container value to write.

MyTable::MyImage

Result Returns OK or error.

Description

Useful if your file should contain a picture or PDF file.

Examples

Write container to file:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/output.pdf" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteContainer"; $fh; test::ContainerField) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh) ]
```

44.18 BinaryFile.WriteFloat

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.WriteFloat"; BinaryFileRef; Value { ; Bits })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Value

The floating point value.

123.456

Bits

Optional

The bit width of the value. Pass 32 for a 32-bit floating point number (single) or 64 for a 64-bit floating point number (double). Default is 32.

32

Result Returns OK or error.

Description

Examples

Write floating point values:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/output.dat" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteFloat"; $fh; 123,456; 32 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteFloat"; $fh; 123,456; 64 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

- 44.19 BinaryFile.WriteHex 1195
- 44.20 BinaryFile.WriteInt 1197
- 44.21 BinaryFile.WriteText 1199

Created 12nd June 2017, last changed 12nd June 2017.

44.19 BinaryFile.WriteHex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.WriteHex"; BinaryFileRef; HexText)

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

HexText

The hex encoded data as text.

"48656C6C6F20576F726C64"

Result Returns OK or error.

Description

Examples

Write Hello World to text:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteHex"; $fh; "48656C6C6F20576F726C64" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

44.20 BinaryFile.WriteInt

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.WriteInt"; BinaryFileRef; Value { ; Bits })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Value

The value to write.

123

Bits

Optional

The number of bits to use. Can be 8, 16, 32 or 64 bit. Default is 32 bit.

32

Result Returns OK or error.

Description

Examples

Write some integers:

```
Set Variable [ $fh ; Value: MBS( "BinaryFile.Create"; "/Users/cs/Desktop/test.txt" ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteInt"; $fh; 123; 8 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteInt"; $fh; 12345; 16 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteInt"; $fh; 123456789; 32 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.WriteInt"; $fh; 123456789012345; 64 ) ]
Set Variable [ $r ; Value: MBS( "BinaryFile.Close"; $fh ) ]
```

- 44.18 BinaryFile.WriteFloat 1194
- 44.19 BinaryFile.WriteHex 1195
- 44.21 BinaryFile.WriteText 1199

44.21 BinaryFile.WriteText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
44 BinaryFile	7.3	Yes	Yes	Yes	Yes	Yes

MBS("BinaryFile.WriteText"; BinaryFileRef; Text { ; Encoding })

Parameters

BinaryFileRef

The reference number for the open file.

\$FH

Text

The text to write.

"Hello World"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF-8"

Result Returns OK or error.

Description

You have to decide which encoding to use (if not UTF-8). We support a few encodings, but we can add more if you need something special.

Please use Text.ReplaceNewline to define which line endings the file has.

If text encoding doesn't support given characters, they are converted to close match if possible or replaced by question marks.

You can pass UTF-16, UTF-16LE or UTF-16BE for encoding, too.

See also Text.WriteTextFile and Text.WriteToContainer.

Examples

Write Hello:

MBS("BinaryFile.WriteText"; \$fh; "Hello"; "UTF8"

Chapter 45

BlueThermProbe

Functions to use a BlueTherm™ Probe device from ThermoWorks with iOS.

You need to get their SDK to use with MBS FileMaker iOS SDK.

45.1 BlueThermProbe.ConnectToDevice

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.ConnectToDevice"; Device)

Parameters

Device

The device identifier, name or index. Empty value is first device.

0

Result Returns OK or error.

Description

Examples

Connect to first device:

MBS("BlueThermProbe.ConnectToDevice"; 0)

See also

- 45.2 BlueThermProbe.ConnectedDevices 1203
- 45.6 BlueThermProbe.DisconnectFromDevice 1208

- 45.10 BlueThermProbe.RemoveDevice

Created 15th August 2019, last changed 16th August 2019.

45.2 BlueThermProbe.ConnectedDevices

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.ConnectedDevices")

Result Returns JSON or error.

Description

This returns a big JSON array with an object for each device including the sensors array with an object for each sensor.

See also

- 45.1 BlueThermProbe.ConnectToDevice 1201
- 45.6 BlueThermProbe.DisconnectFromDevice 1208

Created 15th August 2019, last changed 15th August 2019.

45.3 BlueThermProbe.Device

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.Device"; Device)

Parameters

Device

The device identifier, name or index. Empty value is first device.

0

Result Returns JSON or error.

Description

Returns JSON block with details.

If you only need one sensor record, you can use BlueThermProbe.DeviceSensor function.

See also

- 45.5 BlueThermProbe.Devices 1207
- 45.4 BlueThermProbe.DeviceSensor 1205
- 45.10 BlueThermProbe.RemoveDevice 1212

Created 15th August 2019, last changed 15th August 2019.

45.4 BlueThermProbe.DeviceSensor

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.DeviceSensor"; Device; Sensor)

Parameters

Device

The device identifier, name or index. Empty value is first device.

0

Sensor

The sensor name or index. Empty value is first sensor.

0

Result Returns JSON or error.

Description

Returns JSON block with details for sensor.

Examples

Query sensor details on first sensor of first device:

MBS("BlueThermProbe.DeviceSensor"; 0; 0)

```
Example result: {
  "readingUnitString" : "°C",
  "readingUnit" : 0,
  "readingAsDisplayed" : "",
  "fault" : false,
  "genericTypeString" : "Temperature",
  "index" : 1,
  "displayUnit" : 0,
  "typeString" : "K Thermocouple Fixed",
  "name" : "",
  "type" : 12,
  "readingCelsius" : 25.776786804199219,
  "readingTimestamp" : true,
  "trimValue" : 0,
  "lowAlarmBreached" : false,
  "genericType" : 1,
  "lowAlarm" : 0,
  "readingFahrenheit" : 78.398216247558594,
  "rangeHigh" : true,
  "enabled" : true,
  "highAlarmSignalled" : false,
  "highAlarmEnabled" : false,
  "reading" : 25.776786804199219,
```

```
"displayUnitString" : "°C",  
"highAlarmBreached" : false,  
"rangeLow" : true,  
"lowAlarmSignalled" : false,  
"highAlarm" : 0,  
"lowAlarmEnabled" : false  
}
```

45.4.1 Blog Entries

- [MBS FileMaker Plugin, version 9.5pr3](#)

Created 15th August 2019, last changed 16th August 2019.

45.5 BlueThermProbe.Devices

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.Devices")

Result Returns JSON or error.

Description

This returns a big JSON array with an object for each device including the sensors array with an object for each sensor.

If you only need one device, you can use BlueThermProbe.Device function.

See also

- 45.3 BlueThermProbe.Device 1204
- 45.4 BlueThermProbe.DeviceSensor 1205

Created 15th August 2019, last changed 15th August 2019.

45.6 BlueThermProbe.DisconnectFromDevice

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.DisconnectFromDevice"; Device)

Parameters

Device

The device identifier, name or index. Empty value is first device.

0

Result Returns OK or error.

Description

See also

- 45.2 BlueThermProbe.ConnectedDevices 1203
- 45.1 BlueThermProbe.ConnectToDevice 1201

Created 15th August 2019, last changed 15th August 2019.

45.7 BlueThermProbe.Initialize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.Initialize")

Result Returns OK or error.

Description

This function must be called once to initialize the library and setup all required things.

Rewritten in plugin version 9.4 for BlueTherm LE SDK iOS v2.0.

Please link libThermaLib.a into your FileMaker iOS SDK app by adding it as a required library. Add "Supported external accessory protocols" for Info.plist and add an item "uk.co.etilt.d.bluetherm1". For "Required background modes", please add "App communicates with an accessory".

You can call this in your start script.

45.8 BlueThermProbe.IsBluetoothAvailable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.IsBluetoothAvailable")

Result Returns 1, 0 or error.

Description

Created 15th August 2019, last changed 15th August 2019.

45.9 BlueThermProbe.IsInitialized

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.IsInitialized")

Result Returns 1, 0 or error.

Description

Returns 0, if you need to call BlueThermProbe.Initialized or 1 if that function was called before.

See also

- 45.7 BlueThermProbe.Initialize

1209

Created 15th August 2019, last changed 18th August 2019.

45.10 BlueThermProbe.RemoveDevice

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.RemoveDevice"; Device)

Parameters

Device

The device identifier, name or index. Empty value is first device.

0

Result Returns OK or error.

Description

The device will be re-added if it is rediscovered by a subsequent scan.

See also

- 45.1 BlueThermProbe.ConnectToDevice 1201

Created 15th August 2019, last changed 15th August 2019.

45.11 BlueThermProbe.SendCommand

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SendCommand"; Device; Command)

Parameters

Device

The device identifier, name or index. Empty value is first device.

0

Command

Which command to run.

"Identify"

Result Returns OK or error.

Description

Command	Description
Measure	Requests the device takes a measurement immediately and transmits it.
Identify	Requests the device identifies itself, for example by flashing an LED
FactorySettings	Requests the device returns to factory settings, excluding trim values.
FactoryReset	requests the device returns to factory settings, including trim values.
refresh	Requests all values to be read from the device

Examples

Ask first device to identify:

MBS("BlueThermProbe.SendCommand"; 0; "Identify")

Created 15th August 2019, last changed 16th August 2019.

45.12 BlueThermProbe.SetBatteryLevelScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SetBatteryLevelScript"; Filename; ScriptName)

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

Called when device sends battery level notification.

Parameter is a JSON object with deviceName, deviceIdentifier and timestamp.

Created 15th August 2019, last changed 18th August 2019.

45.13 BlueThermProbe.SetDeviceUpdatedScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SetDeviceUpdatedScript"; Filename; ScriptName)

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

Called when device is updated. This may be the result of a read request or a write request.

Parameter is a JSON object with deviceName, deviceIdentifier and timestamp.

See also

- 45.14 BlueThermProbe.SetDisconnectedScript 1216
- 45.17 BlueThermProbe.SetSensorUpdatedSScript 1219

Created 15th August 2019, last changed 18th August 2019.

45.14 BlueThermProbe.SetDisconnectedScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SetDisconnectedScript"; Filename; ScriptName)

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

Called when device is disconnected. Please note that after disconnection, no information that would normally require a connection, including the serial number, will be accessible, so any information required after disconnection must be cached by the client.

Parameter is a JSON object with deviceName, deviceIdentifier, reason and timestamp.

45.15 BlueThermProbe.SetNewDeviceScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SetNewDeviceScript"; Filename; ScriptName)

Parameters**Filename**

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

Called while scan for devices is running for each new device.

Parameter is a JSON object with deviceName, deviceIdentifier and timestamp.

See also

- 45.18 BlueThermProbe.StartDeviceScan 1220
- 45.19 BlueThermProbe.StopDeviceScan 1221

Created 15th August 2019, last changed 15th August 2019.

45.16 BlueThermProbe.SetNotificationReceivedScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SetNotificationReceivedScript"; Filename; ScriptName)

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

Called when device is sends notification. See type field in parameter to your script.

Parameter is a JSON object with deviceName, deviceIdentifier, type and timestamp.

Name	Type Number	Description
None	0	Button pressed on the device
ButtonPressed	1	Device is about to shut down
Shutdown	2	Device received an invalid setting
InvalidSetting	3	Device received an invalid command
InvalidCommand	4	Device requests app to re-read all data
RefreshRequest	5	Communication error detected
CommunicationError	6	Remote device checkpoint event
Checkpoint	7	Checkpoint

Created 15th August 2019, last changed 20th August 2019.

45.17 BlueThermProbe.SetSensorUpdatedSScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.SetSensorUpdatedSScript"; Filename; ScriptName)

Parameters**Filename**

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

Called when sensor reading was updated.

Parameter is a JSON object with name, reading, deviceName, deviceIdentifier and timestamp.

For temperature, we include readingFahrenheit and readingCelsius.

45.20 BlueThermProbe.VersionNumber

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
45 BlueThermProbe	9.4	No	No	No	No	Yes

MBS("BlueThermProbe.VersionNumber")

Result Returns text or error.

Description

May contain arbitrary characters.

Created 15th August 2019, last changed 15th August 2019.

Chapter 46

Bonjour

Lookup services on local network via zero config technology.

46.1 Bonjour.Browse

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
46 Bonjour	8.4	Yes	Yes	Yes	No	No

MBS("Bonjour.Browse"; Type)

Parameters

Type

The type to browse for.
"_fmp12._tcp"

Result Returns OK or error.

Description

Results from last browse are cleared first.
You need Bonjour library installed on Windows to have this work.

Use Bonjour.JSON functions to query results later. Please let a small pause for network to provide results, which get updated in background.

Examples

Browser for SMB shares:

```
Set Variable [ $r ; Value: MBS("Bonjour.Browse"; "_smb._tcp.") ]
```

Browser for AFP shares:

Set Variable [\$r ; Value: MBS("Bonjour.Browse"; "_afpovertcp._tcp.")]

Browser for FileMaker server:

Set Variable [\$r ; Value: MBS("Bonjour.Browse"; "_fmpro-rcfmp12._tcp.")]

Created 28th July 2018, last changed 28th July 2018.

46.2 Bonjour.JSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
46 Bonjour	8.4	Yes	Yes	Yes	No	No

MBS("Bonjour.JSON")

Result Returns JSON or error.

Description

First level in JSON is an array with services found.

For each service, we list interfaceIndex, type, domain, serviceName, IP and port.

IP and port are brought down from found host and IP.

Hosts array for each service describes the hosts for that service. That can be one or more hosts. Each host may have several IPs to connect to.

Examples

Query results:

```
Set Variable [ $json; MBS( "Bonjour.JSON" ) ]
```

```
Example result: [ {
  "interfaceIndex": 4,
  "type": "_fmpro-rcfmp12._tcp.",
  "domain": "local.",
  "serviceName": "WIN-Test",
  "IP": "2003:e1:6bc2:c272:7029:44d3:99ae:ab87",
  "port": 5003,
  "hosts": [ {
    "interfaceIndex": 4,
    "port": 5003,
    "fullName": "WIN-Test._fmpro-rcfmp12._tcp.local.",
    "hostTarget": "WIN-Test.local.",
    "IPs": [ {
      "port": 5003,
      "interfaceIndex": 4,
      "ip": "2003:e1:6bc2:c272:7029:44d3:99ae:ab87",
      "hostName": "WIN-Test.local.",
      "protocol": "IPv6"
    }, {
      "port": 5003,
      "interfaceIndex": 4,
      "ip": "fe80::7029:44d3:99ae:ab87",
      "hostName": "WIN-Test.local.",
      "protocol": "IPv6"
    }, {
      "port": 5003,
```

```
"interfaceIndex": 4,  
"ip": "192.168.2.122",  
"hostName": "WIN-Test.local",  
"protocol": "IPv4"  
  } ]  
} ]  
} ]
```

Created 28th July 2018, last changed 28th July 2018.

46.3 Bonjour.Register

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
46 Bonjour	8.4	Yes	Yes	Yes	No	Yes

MBS("Bonjour.Register"; Name; Type; Domain; Host; Port)

Parameters

Name

If non-empty, specifies the service name to be registered. Most applications will not specify a name, in which case the computer name is used. If a name is specified, it must be 1-63 bytes of UTF-8 text. If the name is longer than 63 bytes it will be automatically truncated to a legal length.

Type

The service type followed by the protocol, separated by a dot (e.g. "_ftp._tcp"). The service type must be an underscore, followed by 1-14 characters, which may be letters, digits, or hyphens. The transport protocol must be "_tcp" or "_udp". New service types should be registered at <http://www.dns-sd.org/ServiceTypes.html>.

"_test._tcp"

Domain

If non-empty, specifies the domain on which to advertise the service. Most applications will not specify a domain, instead automatically registering in the default domain(s).

Host

If non-empty, specifies the SRV target host name. Most applications will not specify a host, instead automatically using the machine's default host name(s).

Port

The port, in network byte order, on which the service accepts connections. Pass 0 for a "placeholder" service (i.e. a service that will not be discovered by browsing, but will cause a name conflict if another client tries to register that same name). Most clients will not use placeholder services.

1234

Result Returns OK or error.

Description

This service is discovered via Bonjour.Browse function.

Examples

Register test service:

```
MBS( "Bonjour.Register"; "Test"; "_test._tcp"; ""; ""; 1234 )
```

See also

- 46.1 Bonjour.Browse

46.4 Bonjour.RegisteredName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
46 Bonjour	8.4	Yes	Yes	Yes	No	Yes

MBS("Bonjour.RegisteredName")

Result Returns service name or error.

Description

Returns the full name of the service registered currently.

Created 31st July 2018, last changed 31st July 2018.

Chapter 47

Calendar

Functions for the Calendar database on Mac OS X. (iCal)

You may have events or todo items in your FileMaker database. Our plugin can help you sync them into the calendar database on Mac, e.g. create events and reminders into specific calendars. If one Mac has a calendar subscribed for each member of staff and those sync via iCloud/Google/Exchange to their mobile phones, your solution can push events or reminders to your staff on one central routine.

The calendar functions work on Mac OS X for 32 and 64-bit applications. But they are deprecated by Apple and you should move to Events functions for newer projects. Please do not mix Calendar and Events calls as they use different IDs.

On Server you can only use calendar functions if you got a calendar for the user account where the server runs. Normally the server user account has no calendars.

Use this functions to sync events to iCal/Calendar app.

47.1 Calendar.Alarm.Duplicate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Alarm.Duplicate"; alarmRef)

Parameters

alarmRef

The reference to the calendar alarm.

\$alarmRef

Result Returns alarm reference text or error.

Description

Please make a copy whenever you take an alarm from one event to add it to another event.

See also

- 47.22 Calendar.Calendar.Duplicate 1251
- 47.36 Calendar.Item.Duplicate 1268

Created 18th August 2014, last changed 18th August 2014.

47.2 Calendar.Alarm.GetAbsoluteTrigger

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Alarm.GetAbsoluteTrigger"; alarmRef)

Parameters

alarmRef

The reference to the calendar alarm.

\$alarmRef

Result Returns value or error.

Description

The time that an alarm goes off is referred to as the trigger. Alarms have either a relative trigger, which means the alarm fires a certain number of seconds before an alarm occurs, or an absolute trigger, which specifies the exact time the alarm will trigger off. #

See also

- [47.7 Calendar.Alarm.GetRelativeTrigger](#) 1236

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Alarm.GetAction"; alarmRef)

Parameters

alarmRef

The reference to the calendar alarm.

\$alarmRef

Result Returns action name or error.

Description

Action can be: Display, Email, Procedure or Sound.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Alarm.GetRelatedTo"; alarmRef)

Parameters

alarmRef

The reference to the calendar alarm.

\$alarmRef

Result Returns text or error.

Description

See also

- 47.14 Calendar.Alarm.SetRelatedTo

1243

Created 18th August 2014, last changed 18th August 2014.

47.7 Calendar.Alarm.GetRelativeTrigger

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Alarm.GetRelativeTrigger"; alarmRef)

Parameters

alarmRef

The reference to the calendar alarm.

\$alarmRef

Result Returns value or error.

Description

Value is in seconds relative to parent calendar item.

The time that an alarm goes off is referred to as the trigger. Alarms have either a relative trigger, which means the alarm fires a certain number of seconds before an alarm occurs, or an absolute trigger, which specifies the exact time the alarm will trigger off.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Alarm.SetAbsoluteTrigger"; alarmRef; timestamp)

Parameters

alarmRef

The reference to the calendar alarm.

\$alarmRef

timestamp

The new date and time for this alarm.

Get(HostDateTime)+30

Result Returns OK or error.

Description

Setting an absoluteTrigger will also set the relativeTrigger to undefined.

MBS("Calendar.Calendar.GetColor"; calendarRef { ; ReturnAsNumbers })

Parameters

calendarRef

The id of the calendar to query.

\$calendarRef

ReturnAsNumbers

Optional

Available in MBS FileMaker Plugin 8.3 or newer.

Pass 1 to return color as list of red, green and blue, e.g. "123§234§56" Pass 0 (default) for return as hex value, e.g. "7788FF".

0

Result Returns color or error.

Description

Color is returned as hex numbers like "8295AF".

Examples

Check color of calendar by ID:

MBS("Calendar.Calendar.GetColor"; "B560017B-E414-4CD9-B3D1-3D6E7717D714")

Get color for calendar by name:

MBS("Calendar.Calendar.GetColor"; "Public")

47.24 Calendar.Calendar.GetNotes

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Calendar.GetNotes"; calendarRef)

Parameters

calendarRef

The id of the calendar to query.

\$calendarRef

Result Returns notes or error.

Description

Examples

Query notes of first calendar:

```
$list = MBS( "Calendar.Calendars" )
$calendarRef = GetValue( $list ; 1 )
$title = MBS( "Calendar.Calendar.GetNotes"; $calendarRef )
```

Get notes for calendar by ID:

```
MBS( "Calendar.Calendar.GetNotes"; "B560017B-E414-4CD9-B3D1-3D6E7717D714" )
```

Get notes for calendar by name:

```
MBS( "Calendar.Calendar.GetNotes"; "Public" )
```

47.25 Calendar.Calendar.GetTitle

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Calendar.GetTitle"; calendarRef)

Parameters

calendarRef

The id of the calendar to query.

\$calendarRef

Result Returns title or error.

Description

Examples

Queries name of first calendar:

```
$list = MBS( "Calendar.Calendars" )
$calendarRef = GetValue( $list ; 1 )
$title = MBS( "Calendar.Calendar.GetTitle"; $calendarRef )
```

Get title for calendar by ID:

```
MBS( "Calendar.Calendar.GetTitle"; "B560017B-E414-4CD9-B3D1-3D6E7717D714" )
```

47.25.1 FileMaker Magazin

- Ausgabe 1/2014, Seite 32

Created 18th August 2014, last changed 12nd February 2016.

47.26 Calendar.Calendar.GetType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Calendar.GetType"; calendarRef)

Parameters

calendarRef

The id of the calendar to query.

\$calendarRef

Result Returns type or error.

Description

Can be Local, CalDAV, Exchange, Birthday, Subscription or IMAP.

Examples

Check status of calendar named "Privat":

```
MBS( "Calendar.Calendar.GetType"; "Privat" )
```

Check status of calendar with ID:

```
MBS( "Calendar.Calendar.GetType"; "B560017B-E414-4CD9-B3D1-3D6E7717D714" )
```

47.27 Calendar.Calendar.GetUID

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Calendar.GetUID"; calendarRef)

Parameters

calendarRef

The id of the calendar to query.

\$calendarRef

Result Returns ID as text or error.

Description

This is useful to know the unique id of a new calendar after saving it.

Examples

Get UID for calendar by name:

```
MBS( "Calendar.Calendar.GetUID"; "Firma")
```

47.28 Calendar.Calendar.IsEditable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Calendar.IsEditable"; calendarRef)

Parameters**calendarRef**

The id of the calendar to query.

\$calendarRef

Result Return value or error.

Description

Returns 1 if calendar is editable or zero if not.

Examples

Check editable state by ID:

MBS("Calendar.Calendar.IsEditable"; "B560017B-E414-4CD9-B3D1-3D6E7717D714")

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Calendar.SetColor"; calendarRef; Color)

Parameters

calendarRef

The id of the calendar to query.

\$calendarRef

Color

The color to use. Can be a color name or hex notation like in HTML.

"red"

Result Returns OK or error message.

Description

Examples

Sets calendar to red:

MBS("Calendar.Calendar.SetColor"; \$CalendarID; "# FF0000")

47.33 Calendar.Events

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

```
MBS( "Calendar.Events"; startDate; endDate { ; calendarRef } )
```

Parameters

startDate

The start date time stamp.

\$startDate

endDate

The end time stamp. If you want to get events for one day, please pass startDate with that date and time 00:00:00 and for endDate the same date with endDate 23:59:59.

\$endDate

calendarRef

Optional

A calendar identifier or name to search only this calendar. If no calendar is specified, we check all calendars.

\$calendarRef

Result Returns list of event identifiers or error.

Description

If you pass calendar, only this calendar is searched. Else the specific calendar is searched.

If you get no events, please check in system privacy preferences whether FileMaker does have permissions to access the calendars at all.

The system limits results to around 4 years, so if you need to query bigger time spans, please use several calls.

Examples

Queries events:

```
MBS( "Calendar.Events"; myDatabase::StartDate; myDatabase::EndDate )
```

47.58 Calendar.Item.IsDetached

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.IsDetached"; eventRef)

Parameters

eventRef

The reference to the event.

\$eventRef

Result Returns status or error.

Description

If this event is an instance of a repeating event, and an attribute of this event has been changed to from the default value generated by the repeating event, `isDetached` will return 1. If the event is unchanged from its default state, or is not a repeating event, `isDetached` returns 0.

Example Databases

- [Mac only/Calendar/Calendar Events](#)

Created 18th August 2014, last changed 18th August 2014.

47.59 Calendar.Item.NextAlarmDate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.NextAlarmDate"; itemRef)

Parameters

itemRef

The reference to the calendar item. Can be reference to event or reminder.
\$eventRef

Result Returns date or error.

Description

- 47.66 Calendar.Item.SetDueDate 1301
- 47.67 Calendar.Item.SetEndDate 1302
- 47.71 Calendar.Item.SetStartDate 1307

Created 18th August 2014, last changed 18th August 2014.

47.60 Calendar.Item.Occurrence

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.Occurrence"; eventRef)

Parameters

eventRef

The reference to the event.

\$eventRef

Result Returns date or error.

Description

Since all instances of a repeating event have the same UID, we need another way to differentiate between those events. This method returns the date on which this event was originally scheduled to occur. This value will remain the same even if the event has been detached and its start date has changed. For events not part of a repeating pattern, this method will return the same value as startDate.

- [Mac only/Calendar/Calendar Events](#)

Created 18th August 2014, last changed 18th August 2014.

47.61 Calendar.Item.RemoveAlarm

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Item.RemoveAlarm"; itemRef; alarmRef)

Parameters

itemRef

The reference to the calendar item. Can be reference to event or reminder.
\$eventRef

alarmRef

The reference to the calendar alarm.
\$alarmRef

Result Returns OK or error.

Description

Please query list of alarms first with Calendar.Item.GetAlarms function.

47.62 Calendar.Item.SetAllDay

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetAllDay"; eventRef; value)

Parameters**eventRef**

The reference to the calendar item. Can be reference to event or reminder.

\$eventRef

value

The new setting. Pass 1 for all day or zero otherwise.

1

Result Returns OK or error.

Description

Pass 1 for all day or zero otherwise.

47.63 Calendar.Item.SetCalendar

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetCalendar"; itemRef; calendarRef)

Parameters

itemRef

The reference to the calendar item. Can be reference to event or reminder.
\$eventRef

calendarRef

The id of the calendar to query.
\$calendarRef

Result Returns OK or error.

Description

Examples

Create a new reminder:

```
$id = MBS("Calendar.NewReminder")
$r = MBS( "Calendar.Item.SetDueDate"; $id; Get(CurrentHostTimeStamp) )
$r = MBS( "Calendar.Item.SetTitle"; $id; "Test" )
$r = MBS( "Calendar.Item.SetCalendar"; $id; "Erinnerungen" )
$r = MBS( "Calendar.SaveReminder"; $id )
```

Create new event:

```
Set Variable [ $c; Value:MBS("Calendar.NewEvent") ]
# set title and other variables
Set Variable [ $r; Value:MBS("Calendar.Item.SetTitle"; $c; CalendarTest::ItemTitle) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetStartDate"; $c; CalendarTest::ItemStartDate) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetEndDate"; $c; CalendarTest::ItemEndDate) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetAllDay"; $c; CalendarTest::ItemAllDay) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetCalendar"; $c; CalendarTest::CalendarUID) ]
# save event
Set Variable [ $r; Value:MBS("Calendar.SaveEvent"; $c ) ]
```

47.64 Calendar.Item.SetCompleted

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetCompleted"; reminderRef; value)

Parameters

reminderRef

The reference to the reminder.

\$reminderRef

value

The new setting. Pass 1 to mark as completed and 0 to mark as uncompleted.

1

Result Returns OK or error.

Description

Setting the flag to 1 also sets completion date to current timestamp.

Setting this flag to 0 will set the date to be undefined.

47.65 Calendar.Item.SetCompletionDate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetCompletionDate"; reminderRef; Date)

Parameters

reminderRef

The reference to the reminder.

\$reminderRef

Date

The new timestamp for the completion date.

\$date

Result Returns OK or error.

Description

Setting the date also sets the Completed flag to 1.

See also

- 47.46 Calendar.Item.GetCompletionDate 1278
- 47.64 Calendar.Item.SetCompleted 1299

Created 18th August 2014, last changed 18th August 2014.

47.66 Calendar.Item.SetDueDate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetDueDate"; reminderRef; date)

Parameters

reminderRef

The reference to the reminder.

\$reminderRef

date

The new due date.

Get(CurrentTimestamp)

Result Returns OK or error.

Description

There is a bug in OS X which prevents the saving of the time portion of the due date. You can move to Events.Reminder.SetDueDate function to workaroud this.

47.70 Calendar.Item.SetPriority

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetPriority"; reminderRef; value)

Parameters

reminderRef

The reference to the reminder.

\$reminderRef

value

The new priority level.

Result Returns error or OK.

Description

The iCalendar specification allows priority to be specified with an integer in the range of 0-9, with 0 representing an undefined priority, 1 the highest priority, and 9 the lowest priority. When a user sets the priority to high, medium or low in iCal saves the priority as 1, 5, or 9 respectively. Clients are encouraged to use these values when setting a task's priority, but it is possible to specify any integer value from 0 to 9. In iCal, a task with a priority in the range of 1-4 will show up as high priority, a task with a priority of 5 will be displayed as having medium priority, and 6-9 will be displayed as having a low priority.

Created 18th August 2014, last changed 18th August 2014.

47.71 Calendar.Item.SetStartDate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetStartDate"; eventRef; timestamp)

Parameters

eventRef

The reference to the event.

\$eventRef

timestamp

The new start date/time.

Get(CurrentTimestamp)

Result Returns OK or error.

Description

47.72 Calendar.Item.SetTitle

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetTitle"; itemRef; title)

Parameters

itemRef

The reference to the calendar item. Can be reference to event or reminder.
\$eventRef

title

The new title for the calendar item.
"Hello"

Result Returns OK or error.

47.73 Calendar.Item.SetURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Item.SetURL"; itemRef; URL)

Parameters

itemRef

The reference to the calendar item. Can be reference to event or reminder.

\$eventRef

URL

The new URL to store.

"http://www.mbsplugins.de"

Result Returns OK or error.

47.76 Calendar.NewEvent

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.NewEvent")

Result Returns ID of new event.

Description

Calendar item reference numbers are starting at 27000 and counting up for each new item.

Or the plugin returns you the UUID for the event.

Examples

Create an event:

```
# new event
Set Variable [ $c; Value:MBS("Calendar.NewEvent") ]
# set title and other variables
Set Variable [ $r; Value:MBS("Calendar.Item.SetTitle"; $c; CalendarTest::ItemTitle) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetNotes"; $c; CalendarTest::ItemNotes) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetURL"; $c; CalendarTest::ItemURL) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetLocation"; $c;CalendarTest::ItemLocation) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetStartDate"; $c; CalendarTest::ItemStartDate) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetEndDate"; $c; CalendarTest::ItemEndDate) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetAllDay"; $c;CalendarTest::ItemAllDay) ]
Set Variable [ $r; Value:MBS("Calendar.Item.SetCalendar"; $c; CalendarTest::CalendarUID) ]
# save event
Set Variable [ $r; Value:MBS("Calendar.SaveEvent"; $c ) ]
# store id for later reference
Set Field [ CalendarTest::ItemUID; MBS("Calendar.Item.GetUID"; $c) ]
```

47.77 Calendar.NewReminder

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.NewReminder")

Result Returns ID of new reminder.

Description

Calendar item reference numbers are starting at 27000 and counting up for each new item. Or the plugin returns you the UUID for the event.

Examples

Synchronize Todos with Reminders:

```
# Sync Todos as Reminders from FileMaker to Mac Reminder app
# And sync back changes
#
# Please adjust to your fields and your special use case!
# You can optimize to only update fields on each side if changed
#

Go to Record/Request/Page [ First ]

47.79 Calendar.Notification.Evaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	6.2	Yes	No	No	No	No

MBS("Calendar.Notification.Evaluate"; Expression)

Parameters

Expression

The expression to evaluate.

"Let (\$\$Done = 1 ; 1)"

Result Returns OK or error.

Description

This expression is evaluated whenever something in the calendar database changed.

47.80 Calendar.Notification.GetChangedExternally

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Notification.GetChangedExternally")

Result Returns 1 or 0.

Description

If this function returns zero, the change was made by your own FileMaker solution.

This property is not always set by the OS for all changes, especially with some sync services.

47.81 Calendar.Notification.GetDeletedRecords

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Notification.GetDeletedRecords")

Result Returns list of record IDs.

Description

Only valid in a notification script.

Please note that the plugin may not be able to provide information for deleted record contents.

Values in this list are IDs of calendars, events, or reminders, depending on the notification (See Calendar.Notification.GetWhat). If all three lists (updatedRecords, DeletedRecords, InsertedRecords) are empty, that indicates everything has changed, and the client should refresh the calendar, event, and reminder information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

47.88 Calendar.Notification.Set

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.5	Yes	No	No	No	No

MBS("Calendar.Notification.Set"; FileName; ScriptName)

Parameters

FileName

The name of the FileMaker File that contains the script.

"test.fmp12"

ScriptName

The name of the script to run.

"MyScript"

Result Returns OK on success.

Description

This script is called whenever something in the calendar database changed.

It can be useful to just call this function without a script name just to have the plugin watch for changes in calendar and clear it's cache.

With plugin version 6.0 or newer the script name can be a script ID number. In that case the plugin queries the script name for the given script ID. This allows to call scripts by ID and avoid problems if scripts are later renamed.

Examples

Installs notification script:

MBS("Calendar.Notification.Set"; "test.fp7"; "MyScript")

47.93 Calendar.SaveEvent

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.SaveEvent"; eventRef)

Parameters

eventRef

The id of the event to query.

\$eventRef

Result Returns OK or error.

Description

Examples

Creates new event:

```
$c = MBS("Calendar.NewEvent");
$r = MBS("Calendar.Item.SetTitle"; $c; CalendarTest::ItemTitle)
$r = MBS("Calendar.Item.SetNotes"; $c; CalendarTest::ItemNotes)
$r = MBS("Calendar.Item.SetURL"; $c; CalendarTest::ItemURL)
$r = MBS("Calendar.Item.SetLocation"; $c; CalendarTest::ItemLocation)
$r = MBS("Calendar.Item.SetStartDate"; $c; CalendarTest::ItemStartDate)
$r = MBS("Calendar.Item.SetEndDate"; $c; CalendarTest::ItemEndDate)
$r = MBS("Calendar.Item.SetAllDay"; $c; CalendarTest::ItemAllDay)
$r = MBS("Calendar.Item.SetCalendar"; $c; CalendarTest::CalendarUID)
$r = MBS("Calendar.SaveEvent"; $c )
```

Create a new reminder:

```
$id = MBS("Calendar.NewReminder")
$r = MBS( "Calendar.Item.SetDueDate"; $id; Get(CurrentHostTimeStamp) )
$r = MBS( "Calendar.Item.SetTitle"; $id; "Test" )
$r = MBS( "Calendar.Item.SetCalendar"; $id; "Erinnerungen" )
$r = MBS( "Calendar.SaveReminder"; $id )
```

47.94 Calendar.SaveReminder

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.SaveReminder"; reminderRef)

Parameters

reminderRef

The id of the reminder to query.

\$reminderRef

Result Returns OK or error.

Description

Examples

Synchronize Todos with Reminders:

```
# Sync Todos as Reminders from FileMaker to Mac Reminder app
# And sync back changes
#
# Please adjust to your fields and your special use case!
# You can optimize to only update fields on each side if changed
#

Go to Record/Request/Page [ First ]
Loop
# Check if we have an ID for this todo already
If [ Todos::SyncUID = "" ]

47.95 Calendar.SelectEvent

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.SelectEvent"; EventRef; OccuranceDate)

Parameters**EventRef**

The reference to the event.

\$EventRef

OccuranceDate

The occurrence date.

\$OccuranceDate

Result Returns new temporary event ID or error.

Description

This will select an event and return a new reference which you can use for other editing functions to work on an event.

Some events have several occurrence dates, but same unique IDs.

47.96 Calendar.Tasks

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.Tasks" { ; calendarRef })

Parameters

calendarRef

Optional

A calendar identifier or name to search only this calendar.

\$calendarRef

Result Returns list of task/reminder identifiers or error.

Description

If you pass calendar, only this calendar is searched. Else all calendars are searched.

Examples

Queries tasks:

MBS("Calendar.Tasks")

47.97 Calendar.TasksCompletedSince

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.TasksCompletedSince"; completedSince { ; calendarRef })

Parameters

completedSince

The date where we search tasks after.

\$completedSince

calendarRef

Optional

A calendar identifier or name to search only this calendar.

\$calendarRef

Result Returns list of task/reminder identifiers or error.

Description

If you pass calendar, only this calendar is searched. Else all calendars are searched.

Examples

Queries tasks:

MBS("Calendar.TasksCompletedSince"; \$completedSince)

MBS("Calendar.UncompletedTasks" { ; calendarRef })

Parameters

calendarRef

Optional

Optional, a calendar identifier or name to search only this calendar.

\$calendarRef

Result Returns list of task/reminder identifiers or error.

Description

If you pass calendar, only this calendar is searched. Else all calendars are searched.

Examples

Queries tasks:

MBS("Calendar.UncompletedTasks")

47.99 Calendar.UncompletedTasksDueBefore

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
47 Calendar	3.4	Yes	No	No	No	No

MBS("Calendar.UncompletedTasksDueBefore"; dueDate { ; calendarRef })

Parameters

dueDate

The date where we search tasks before.

\$dueDate

calendarRef

Optional

Optional, a calendar identifier or name to search only this calendar.

\$calendarRef

Result Returns list of task/reminder identifiers or error.

Description

If you pass calendar, only this calendar is searched. Else all calendars are searched.

Examples

Queries tasks:

```
MBS( "Calendar.UncompletedTasksDueBefore"; $dueDate )
```

Chapter 48

Certificates

X509 Certificates and PKCS12 file handling.

48.1 PKCS12.CA

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKCS12.CA"; PKCS12 Reference; Index)

Parameters

PKCS12 Reference

The reference to the PKCS12.

\$pkcs12

Index

The index of the certificate to get. From 0 to PKCS12.CACount-1.

0

Result Returns X509 reference number or error.

Description

A PKCS12 file may contain more than one certificate.

Examples

Query certificates:

```
Set Variable [ $p12; Value:MBS( "PKCS12.ReadFromContainer"; test::Container; "Geslo123# " ) ]
```

```
If [ MBS("IsError") ]
```

```
Show Custom Dialog [ "Error"; $p12 ]
```

```
Else
```

```
Set Variable [ $count; Value:MBS( "PKCS12.CACount"; $p12 ) ]
```

```
Set Variable [ $index; Value:0 ]
Loop
Set Variable [ $cert; Value:MBS( "PKCS12.CA"; $p12; $index ) ]
Show Custom Dialog [ "Certificate"; MBS( "X509.Description"; $cert ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $index >= $count ]
End Loop
Set Variable [ $r; Value:MBS( "PKCS12.Release"; $p12 ) ]
End If
```

Created 23th December 2016, last changed 23th December 2016.

48.2 PKCS12.CACount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKCS12.CACount"; PKCS12 Reference)

Parameters

PKCS12 Reference

The reference to the PKCS12.

\$pkcs12

Result Returns OK or error.

Description

Examples

Get count:

Set Variable [\$count; Value:MBS("PKCS12.CACount"; \$p12)]

See also

48.3 PKCS12.Cert

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKCS12.Cert"; PKCS12 Reference)

Parameters

PKCS12 Reference

The reference to the PKCS12.

\$pkcs12

Result Returns X509 reference number or error.

Description

Examples

Get certificate:

Set Variable [\$cert; Value:MBS("PKCS12.Cert"; \$p12)]

See also

- 48.5 PKCS12.ReadFromContainer 1350

48.4 PKCS12.PKey

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKCS12.PKey"; PKCS12 Reference)

Parameters

PKCS12 Reference

The reference to the PKCS12.

\$pkcs12

Result Returns PKey reference number or error.

Description

Examples

Get private key:

Set Variable [\$pkey; Value:MBS("PKCS12.PKey"; \$p12)]

See also

- 48.5 PKCS12.ReadFromContainer 1350
- 48.6 PKCS12.ReadFromFile 1352

Created 23th December 2016, last changed 23th December 2016.

48.5 PKCS12.ReadFromContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKCS12.ReadFromContainer"; Container { ; Password })

Parameters

Container

The container with the certificate file.

Password

Optional

The password for the p12 file.

"Hello"

Result Returns PKCS12 reference number or error.

Description

Please call PKCS12.Release later to release memory.

Examples

Read PKCS12 from container and shows details:

```
Set Variable [ $p12; Value:MBS( "PKCS12. ReadFromContainer"; MyTable::MyContainerField; "test" ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $p12 ]
Else
Set Variable [ $cert; Value:MBS( "PKCS12.Cert"; $p12 ) ]
Set Variable [ $pkey; Value:MBS( "PKCS12.PKey"; $p12 ) ]
Set Variable [ $CACount; Value:MBS( "PKCS12.CACount"; $p12 ) ]
Show Custom Dialog [ "Certificate"; MBS( "X509.Description"; $cert ) ]
Show Custom Dialog [ "Private Key"; MBS( "PKey.DescriptionPrivateKey"; $pkey ) ]
Set Variable [ $r; Value:MBS( "PKey.Release"; $pkey ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
Set Variable [ $r; Value:MBS( "PKCS12.Release"; $p12 ) ]
End If
```

48.6 PKCS12.ReadFromFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKCS12.ReadFromFile"; Path; Password)

Parameters

Path

The native file path to the PEM file.

"/Users/cs/Desktop/test.pem"

Password

The password for the p12 file.

"Hello"

Result Returns PKCS12 reference number or error.

Description

Please call PKCS12.Release later to release memory.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Read PKCS12 file and shows details:

```
Set Variable [ $p12; Value:MBS( "PKCS12.ReadFromFile"; "/Users/cs/Desktop/test.p12"; "test" ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $p12 ]
Else

48.13 PKCS7.SignedDataCertCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	9.1	Yes	Yes	Yes	Yes	Yes

MBS("PKCS7.SignedDataCertCount"; PKCS7 Reference)

Parameters

PKCS7 Reference

The reference to the PKCS# 7.

\$pkcs7

Result Returns number or error.

Description

Examples

Show number of certificates:

```
Set Variable [ $pkcs7 ; Value: MBS( "PKCS7.ReadFromFile"; "/Users/cs/Desktop/IT12345.xml.p7m" ) ]
```

```
Show Custom Dialog [ "Content" ; MBS( "PKCS7.SignedDataCertCount"; $pkcs7 ) ]
```

```
Set Variable [ $r ; Value: MBS( "PKCS7.Release"; $pkcs7 ) ]
```

Created 6th March 2019, last changed 6th March 2019.

48.14 PKCS7.SignedDataContent

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	9.1	Yes	Yes	Yes	Yes	Yes

MBS("PKCS7.SignedDataContent"; PKCS7 Reference { ; Encoding })

Parameters

PKCS7 Reference

The reference to the PKCS# 7.

\$pkcs7

Encoding

Optional

The text encoding for result. Default is native. Can be hex or base64 for binary data.

"UTF8"

Result Returns text or error.

Description

In Italy digitally signed e-invoices in CADES format include an embedded XML payload in a signed P7M file.

Examples

Read XML embedded in p7m file:

```
Set Variable [ $pkcs7 ; Value: MBS( "PKCS7.ReadFromFile"; "/Users/cs/Desktop/IT12345.xml.p7m" ) ]
Show Custom Dialog [ "Content" ; MBS( "PKCS7.SignedDataContent"; $pkcs7; "UTF-8" ) ]
Set Variable [ $r ; Value: MBS( "PKCS7.Release"; $pkcs7 ) ]
```

48.15 PKey.Bits

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKey.Bits"; PKeyRef)

Parameters

PKeyRef

The reference to the private key.

\$pkey

Result Returns bits count or error.

Description

Created 23th December 2016, last changed 23th December 2016.

48.16 PKey.DescriptionPrivateKey

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKey.DescriptionPrivateKey"; PKeyRef)

Parameters**PKeyRef**

The reference to the private key.

\$pkey

Result Returns text or error.

Description

This is only for human to read.

48.21 PKey.Type

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("PKey.Type"; PKeyRef)

Parameters

PKeyRef

The reference to the private key.

\$pkey

Result Returns text or error.

Description

Can be DH, DSA, RSA or EC.

Created 23th December 2016, last changed 23th December 2016.

48.22 X509.Description

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.Description"; X509Ref)

Parameters

X509Ref

The reference to the X509 certificate.

\$cert

Result Returns text or error.

Description

This is only for human to read.

Examples

Shows description of certificate:

```
Set Variable [ $cert; Value:MBS( "X509.Read"; test::Cert ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $cert ]
Else
Show Custom Dialog [ "Description"; MBS( "X509.Description"; $cert ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
End If
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.IssuerName"; X509Ref)

Parameters**X509Ref**

The reference to the X509 certificate.

\$cert

Result Returns text or error.

Description

Returns a list of key=value entries.

Examples

Shows issuer name:

```
Set Variable [ $cert; Value:MBS( "X509.Read"; test::Cert ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $cert ]
Else
Show Custom Dialog [ "IssuerName"; MBS( "X509.IssuerName"; $cert ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
End If

48.26 X509.Read

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.Read"; Text)

Parameters

Text

The certificate in PEM format as text.

Result Returns X509 reference number or error.

Description

See also X509.ReadFromContainer for reading from container and X509.ReadFromFile to read from file on disk.

Examples

Reads a certificate and shows name:

```
Set Variable [ $cert; Value:MBS( "X509.Read"; test::Cert ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $cert ]
Else
Show Custom Dialog [ "Name"; MBS( "X509.Name"; $cert ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
End If

48.27 X509.ReadFromContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.ReadFromContainer"; Container)

Parameters

Container

The container with the certificate file.

Result Returns X509 reference number or error.

Description

Examples

Reads a certificate and shows name:

```
Set Variable [ $cert; Value:MBS( "X509.ReadFromContainer";test::Container ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $cert ]
Else
Show Custom Dialog [ "Name"; MBS( "X509.Name"; $cert ) ]

48.28 X509.ReadFromFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.ReadFromFile"; Path)

Parameters

Path

The native file path to the PEM file.

"/Users/cs/Desktop/test.pem"

Result Returns X509 reference number or error.

Description

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Reads a certificate and shows name:

```
Set Variable [ $cert; Value:MBS( "X509.ReadFromFile"; "/Users/cs/Desktop/test.pem" ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $cert ]
Else
Show Custom Dialog [ "Name"; MBS( "X509.Name"; $cert ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
End If
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.SerialNumber"; X509Ref)

Parameters**X509Ref**

The reference to the X509 certificate.

\$cert

Result Returns text or error.

Description**Examples**

Shows the serial number:

```
Show Custom Dialog [ "Serial Number"; MBS( "X509.SerialNumber"; $cert ) ]
```

Shows serial and description:

```
Set Variable [ $cert; Value:MBS( "X509.ReadFromFile"; "/Users/cs/Desktop/test.pem" ) ]
```

```
Show Custom Dialog [ "Serial"; MBS( "X509.SerialNumber"; $cert ) ]
```

48.31 X509.ShowDialog

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	9.2	Yes	No	No	No	No

MBS("X509.ShowDialog"; X509Ref)

Parameters

X509Ref

The reference to the X509 certificate.

\$cert

Result Returns OK or error.

Description

Displays the content of the certificate in the standard dialog to user.

Examples

Show certificate:

```
Set Variable [ $cert ; Value: MBS( "X509.Read"; Zertifikat::Certificate Text ) ]
```

```
Set Variable [ $serial ; Value: MBS( "X509.ShowDialog"; $cert ) ]
```

```
Set Variable [ $r ; Value: MBS( "X509.Release"; $cert ) ]
```

48.32 X509.SubjectName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.SubjectName"; X509Ref)

Parameters**X509Ref**

The reference to the X509 certificate.

\$cert

Result Returns text or error.

Description

Returns a list of key=value entries.

Examples

Shows subject name:

```
Set Variable [ $cert; Value:MBS( "X509.Read"; test::Cert ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Error"; $cert ]
Else
Show Custom Dialog [ "SubjectName"; MBS( "X509.SubjectName"; $cert ) ]
Set Variable [ $r; Value:MBS( "X509.Release"; $cert ) ]
End If

48.33 X509.Version

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	7.0	Yes	Yes	Yes	Yes	Yes

MBS("X509.Version"; X509Ref)

Parameters

X509Ref

The reference to the X509 certificate.

\$cert

Result Returns OK or error.

Description

Currently usually 2 for version 3.

Examples

Shows version:

```
Show Custom Dialog [ "Version"; MBS( "X509.Version"; $cert ) ]
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
48 Certificates	9.1	Yes	Yes	Yes	Yes	Yes

MBS("X509.Write"; X509Ref { ; Binary })

Parameters**X509Ref**

The reference to the X509 certificate.

\$cert

Binary

Optional

Whether to return binary representation (DER format) instead of text (PEM format). Default is PEM.

0

Result Returns text or error.

Description

Provides either PEM file as text or DER file base64 encoded.

Created 22nd February 2019, last changed 25th February 2019.

Chapter 49

CGImageSource

Mac OS X Image loading functions to query metadata and thumbnails.

Can be used to get thumbnails from images or to query EXIF, IPTC or GPS metadata from images.

49.1 CGImageSource.ClearProperties

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	9.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.ClearProperties"; Ref)

Parameters

Ref

The image source reference number returned by CGImageSource.CreateWithData, CGImageSource.CreateWithPath or CGImageSource.CreateWithURL
\$ref

Result Returns OK or error.

Description

Allows you to save image with empty properties, so no EXIF/IPTC data is stored.

See also

- 49.3 CGImageSource.CreateWithData 1386
- 49.4 CGImageSource.CreateWithPath 1387

Created 5th September 2019, last changed 5th September 2019.

49.2 CGImageSource.Count

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.Count"; Ref)

Parameters

Ref

The image source reference number returned by `CGImageSource.CreateWithData`, `CGImageSource.CreateWithPath` or `CGImageSource.CreateWithURL`

\$ref

Result Returns number of images or error message.

Description

Examples

Query count:

MBS("CGImageSource.Count"; \$ref)

- 49.15 `CGImageSource.Status` 1407
- 49.18 `CGImageSource.ThumbnailAtIndex` 1411
- 49.19 `CGImageSource.Type` 1413

Created 18th August 2014, last changed 18th August 2014.

49.3 CGImageSource.CreateWithData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.CreateWithData"; data)

Parameters

data

A value from a Container Field.

Result Returns the reference number for this image source or error message.

Description

Don't forget to call CGImageSource.Release later to release the reference number.

Examples

Convert image from one container and output to other:

```
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithData"; test::input ) ]
Set Field [ test::output ; MBS( "CGImageSource.ImageAtIndex"; $img; 0; "PNG" ) ]
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

Created 18th August 2014, last changed 5th January 2018.

49.4 CGImageSource.CreateWithPath

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.CreateWithPath"; Path)

Parameters

Path

The platform specific native file path.

"/test.jpg"

Result Returns the reference number for this image source or error message.

Description

Don't forget to call CGImageSource.Release later to release the reference number.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Load image and show it:

```
Set Variable [ $path ; Value: "/Users/cs/Pictures/IMG_3625.jpg" ]
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithPath"; $path ) ]
Set Field [ test::output ; MBS( "CGImageSource.ImageAtIndex"; $img; 0 ) ]
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

Read HEIC image:

```
Set Variable [ $path ; Value: "/Users/cs/Desktop/IMG_3552.HEIC" ]
Set Variable [ $ImageSource ; Value: MBS( "CGImageSource.CreateWithPath"; $path ) ]
If [ MBS("IsError") = 0 ]
# you can get metadata as JSON to check later...
Set Variable [ $$MetaData ; Value: MBS( "CGImageSource.Properties"; $ImageSource ) ]
Set Variable [ $$ImageMetaData ; Value: MBS( "CGImageSource.Properties"; $ImageSource; 0 ) ]
# get image to show

49.5 CGImageSource.CreateWithURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.CreateWithURL"; URL)

Parameters

URL

The URL to the file.

\$URL

Result Returns the reference number for this image source or error message.

Description

Don't forget to call CGImageSource.Release later to release the reference number.

CoreGraphics Image Source reference numbers are starting at 25000 and counting up for each new image source.

Examples

Loads image and shows it:

```
Set Variable [ $url ; Value: "http://www.monkeybreadsoftware.de/images/fmplugin16.png" ]
```

```
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithURL"; $url ) ]
```

```
Set Field [ test::output ; MBS( "CGImageSource.ImageAtIndex"; $img; 0 ) ]
```

```
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

49.6 CGImageSource.Export

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	9.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.Export"; Ref; FileName)

Parameters

Ref

The image source reference number returned by CGImageSource.CreateWithData, CGImageSource.CreateWithPath or CGImageSource.CreateWithURL

\$ref

FileName

The file name to use. If empty, we use the name of the loaded image. Falls back to export.jpg if no name is provided. Image destination is defined by file type from file name.

"test.jpg"

Result Returns container value or error.

Description

Uses the image compression based on the file name used.

If possible, we move through data without recompressing image.

Use Container.WriteFile to write the image to a disk file.

Examples

Changes some metadata and exports image:

```
Set Variable [ $ref ; Value: MBS("CGImageSource.CreateWithData"; CGImageSource::ImageFile) ]
Set Variable [ $keys ; Value: MBS( "CGImageSource.SetProperty"; $ref; 0; " { IPTC } .Keywords";
"House,Garden" ) ]
Set Variable [ $keys ; Value: MBS( "CGImageSource.SetProperty"; $ref; 0; " { IPTC } .Caption/Abstract";
"House with garden" ) ]
Set Variable [ $keys ; Value: MBS( "CGImageSource.SetProperty"; $ref; 0; " { TIFF } .ImageDescription";
"House with garden" ) ]
Set Variable [ $Image ; Value: MBS("CGImageSource.Export"; $ref) ]
Set Field [ CGImageSource::output ; $image ]
Set Variable [ $r ; Value: MBS("CGImageSource.Release"; $ref) ]
```

49.7 CGImageSource.FileName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	9.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.FileName")

Result Returns text or error.

Description

Examples

Queries filename:

```
Set Variable [ $ref ; Value: MBS("CGImageSource.CreateWithData"; CGImageSource::ImageFile) ]
Show Custom Dialog [ "filename" ; MBS( "CGImageSource.FileName"; $ref ) ]
Set Variable [ $r ; Value: MBS("CGImageSource.Release"; $ref) ]

49.8 CGImageSource.HasProperty

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	9.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.HasProperty"; Ref; Index; Key)

Parameters

Ref

The image source reference number returned by CGImageSource.CreateWithData, CGImageSource.CreateWithPath or CGImageSource.CreateWithURL

\$ref

Index

The index of the image to query. -1 for global properties. Else a number from 0 to CGImageSource.Count-1.
0

Key

The property name to query.
"PixelWidth"

Result Returns 1, 0 or error.

Description

Returns 1 if property is found.

49.9 CGImageSource.ImageAtIndex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.ImageAtIndex"; Ref; Index { ; ImageType; Filename })

Parameters

Ref

The image source reference number returned by `CGImageSource.CreateWithData`, `CGImageSource.CreateWithPath` or `CGImageSource.CreateWithURL`

\$ref

Index

The index of the image to query. -1 for global properties. Else a number from 0 to `CGImageSource.Count-1`.

0

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.
"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.
"test.jpg"

Result Returns image or error message.

Description

This function can be used to query previews of various image formats including RAW images. (everything Preview app can also open)

Examples

Convert image from one container and output to other:

```
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithData"; test::input ) ]
Set Field [ test::output ; MBS( "CGImageSource.ImageAtIndex"; $img; 0; "PNG" ) ]
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

Read HEIC image:

```
Set Variable [ $path ; Value: "/Users/cs/Desktop/IMG_3552.HEIC" ]
Set Variable [ $ImageSource ; Value: MBS( "CGImageSource.CreateWithPath"; $path ) ]
If [ MBS("IsError") = 0 ]
# you can get metadata as JSON to check later...
Set Variable [ $$MetaData ; Value: MBS( "CGImageSource.Properties"; $ImageSource ) ]
Set Variable [ $$ImageMetaData ; Value: MBS( "CGImageSource.Properties"; $ImageSource; 0 ) ]
# get image to show
```

49.9. *CGIMAGESOURCE.IMAGEATINDEX*

1395

```
Set Variable [ $image ; Value: MBS( "CGImageSource.ImageAtIndex"; $ImageSource; 0; "PNG"; "image.png" ) ]
If [ MBS("IsError") = 0 ]
Set Field [ Untitled::image ; $image ]
End If
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $ImageSource ) ]
End If
```

49.10 CGImageSource.Keys

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.Keys"; Ref; Index)

Parameters

Ref

The image source reference number returned by `CGImageSource.CreateWithData`, `CGImageSource.CreateWithPath` or `CGImageSource.CreateWithURL`

\$ref

Index

The index of the image to query. -1 for global properties. Else a number from 0 to `CGImageSource.Count-1`.
0

Result Returns the list of keys or error message.

Description

The list of keys varies depending on which image format is used and whether EXIF, IPTC or XMP metadata is available.

e.g. keys for a JPEG image:

```
{ TIFF } .Software, { TIFF } .Orientation, { TIFF } .DateTime, { TIFF } .Artist, { TIFF } .Make, {
TIFF } .Model, Depth, { IPTC } .Byline, { IPTC } .SpecialInstructions, { IPTC } .DigitalCreationDate,
{ IPTC } .DigitalCreationTime, { IPTC } .DateCreated, { IPTC } .TimeCreated, { IPTC } .StarRating,
PixelHeight, { Exif } .ExifVersion, { Exif } .Flash, { Exif } .CameraOwnerName, { Exif } .LensModel,
{ Exif } .RecommendedExposureIndex, { Exif } .SubsecTimeOriginal, { Exif } .ExposureMode, { Exif }
.LensSpecification, { Exif } .LensSerialNumber, { Exif } .FNumber, { Exif } .PixelYDimension, { Exif
} .ApertureValue, { Exif } .FocalPlaneXResolution, { Exif } .MeteringMode, { Exif } .FocalPlaneResolu-
tionUnit, { Exif } .ISOSpeedRatings, { Exif } .ExposureBiasValue, { Exif } .ShutterSpeedValue, { Exif }
.SceneCaptureType, { Exif } .MaxApertureValue, { Exif } .CustomRendered, { Exif } .FocalLength, { Exif }
.FocalPlaneYResolution, { Exif } .DateTimeOriginal, { Exif } .FlashPixVersion, { Exif } .SubsecTime, { Exif
} .ColorSpace, { Exif } .PixelXDimension, { Exif } .SubsecTimeDigitized, { Exif } .SensitivityType, { Exif
} .DateTimeDigitized, { Exif } .BodySerialNumber, { Exif } .ComponentsConfiguration, { Exif } .White-
Balance, { Exif } .ExposureTime, { Exif } .ExposureProgram, { JFIF } .DensityUnit, { JFIF } .YDensity,
{ JFIF } .JFIFVersion, { JFIF } .XDensity, ProfileName, DPIWidth, { ExifAux } .LensID, { ExifAux }
.SerialNumber, { ExifAux } .FlashCompensation, { ExifAux } .LensInfo, { ExifAux } .LensSerialNumber, {
ExifAux } .LensModel, { ExifAux } .Firmware, DPIHeight, ColorModel, Orientation and PixelWidth.
```

Examples

Queries keys for an image:

```
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithData"; test::input ) ]
Show Custom Dialog [ "Keys" ; MBS( "CGImageSource.Keys"; $img; 0 ) ]
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

49.12 CGImageSource.Property

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.Property"; Ref; Index; Key)

Parameters

Ref

The image source reference number returned by `CGImageSource.CreateWithData`, `CGImageSource.CreateWithPath` or `CGImageSource.CreateWithURL`

\$ref

Index

The index of the image to query. -1 for global properties. Else a number from 0 to `CGImageSource.Count-1`.
0

Key

The property name to query.

"PixelWidth"

Result Returns the value or error message.

Description

See `CGImageSource.Keys` for a list of available properties.

Keys include (list not complete):

FileSize, { Exif } .ExposureTime, { Exif } .SubjectDistRange, { Exif } .MaxApertureValue, { Exif } .Flash, { Exif } .ColorSpace, { Exif } .ExifVersion, { Exif } .FocalLenIn35mmFilm, { Exif } .SceneCaptureType, { Exif } .ShutterSpeedValue, { Exif } .FNumber, { Exif } .LightSource, { Exif } .FileSource, { Exif } .Saturation, { Exif } .PixelYDimension, { Exif } .Sharpness, { Exif } .ApertureValue, { Exif } .Contrast, { Exif } .PixelXDimension, { Exif } .CustomRendered, { Exif } .WhiteBalance, { Exif } .DateTimeDigitized, { Exif } .ExposureProgram, { Exif } .ISOSpeedRatings, { Exif } .DateTimeOriginal, { Exif } .MeteringMode, { Exif } .FlashPixVersion, { Exif } .ComponentsConfiguration, { Exif } .ExposureMode, { Exif } .DigitalZoomRatio, { Exif } .ExposureBiasValue, ColorModel, Orientation, DPIHeight, PixelWidth, { IPTC } .Caption/Abstract, { IPTC } .TimeCreated, { IPTC } .DateCreated, { IPTC } .DigitalCreationDate, { IPTC } .DigitalCreationTime, PixelHeight, ProfileName, Depth, { TIFF } .Model, { TIFF } .ResolutionUnit, { TIFF } .YResolution, { TIFF } .XResolution, { TIFF } .Orientation, { TIFF } .ImageDescription, { TIFF } .Software, { TIFF } .DateTime, { TIFF } .Make, { JFIF } .DensityUnit, { JFIF } .IsProgressive, { JFIF } .YDensity, { JFIF } .JFIFVersion, { JFIF } .XDensity, DPIWidth.

Version 10.0 and newer may return arrays and dictionaries as JSON.

Examples

Query Image dimensions in pixel :

```
MBS( "CGImageSource.Property"; $ref; 0; "PixelWidth") & " x " & MBS( "CGImageSource.Property";
$ref; 0; "PixelHeight")
```

Query Image resolution in dpi:

```
MBS( "CGImageSource.Property"; $ref; 0; "DPIWidth") & " x " & MBS( "CGImageSource.Property"; $ref;
0; "DPIHeight")
```

Query GPS of first image:

```
Set Variable [ $img ; Value: MBS("CGImageSource.CreateWithData"; CGImageSource::ImageFile) ]
Set Variable [ $lat ; Value: MBS("CGImageSource.Property"; $img; 0; " { GPS } .Latitude") ]
Set Variable [ $long ; Value: MBS("CGImageSource.Property"; $img; 0; " { GPS } .Longitude") ]
Show Custom Dialog [ "GPS" ; $lat & " / " & $long ]
Set Variable [ $r ; Value: MBS("CGImageSource.Release"; $img) ]
```

49.14 CGImageSource.SetProperty

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	9.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.SetProperty"; Ref; Index; Key; Value)

Parameters

Ref

The image source reference number returned by CGImageSource.CreateWithData, CGImageSource.CreateWithPath or CGImageSource.CreateWithURL

\$ref

Index

The index of the image to query. -1 for global properties. Else a number from 0 to CGImageSource.Count-1.
0

Key

The property name to query.

"PixelWidth"

Value

The value to use. Can be text, timestamp, boolean or number.

"Hello"

Result Returns OK or error.

Description

You may need to use CGImageSource.Export to actually write an image with new metadata.

49.15 CGImageSource.Status

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.Status"; Ref { ; Index })

Parameters

Ref

The image source reference number returned by `CGImageSource.CreateWithData`, `CGImageSource.CreateWithPath` or `CGImageSource.CreateWithURL`

\$ref

Index

Optional

The index of the image to query. -1 for global properties. Else a number from 0 to `CGImageSource.Count-1`.
0

Result Returns status number or error message.

Description

Possible status values:

<code>kCGImageStatusUnexpectedEOF</code>	-5	The end of the file was encountered unexpectedly.
<code>kCGImageStatusInvalidData</code>	-4	The data is not valid.
<code>kCGImageStatusUnknownType</code>	-3	The image is an unknown type.
<code>kCGImageStatusReadingHeader</code>	-2	In the process of reading the header.
<code>kCGImageStatusIncomplete</code>	-1	The operation is not complete
<code>kCGImageStatusComplete</code>	0	The operation is complete.

Examples

Checks status:

```
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithData"; test::input ) ]
Show Custom Dialog [ "Status" ; MBS( "CGImageSource.Status"; $img; 0 ) ]
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

49.18 CGImageSource.ThumbnailAtIndex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.ThumbnailAtIndex"; Ref; Index { ; ImageType; Filename })

Parameters

Ref

The image source reference number returned by CGImageSource.CreateWithData, CGImageSource.CreateWithPath or CGImageSource.CreateWithURL

\$ref

Index

The index of the image to query. -1 for global properties. Else a number from 0 to CGImageSource.Count-1.
0

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.
"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.
"test.jpg"

Result Returns image or error message.

Description

If the image source is a PDF, this function creates a 72 dpi image of the PDF page specified by the index that you pass.

Maximum thumbnail size is 512 pixel.

This function can be used to query previews of various image formats including RAW images. (everything Preview app can also open)

Examples

Create a thumbnail:

```
Set Variable [ $ref; Value:MBS("CGImageSource.CreateWithData"; MyTable::ImageFile) ]
Set Variable [ $image; Value:MBS("CGImageSource.ThumbnailAtIndex"; $ref; 0; "JPEG"; "thumbnail.jpg") ]
Set Variable [ $r; Value:MBS("CGImageSource.Release"; $ref) ]
```

Create thumbnail from a file on disk:

```
Set Variable [ $path ; Value: "/Users/cs/Pictures/IMG_3625.jpg" ]
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithPath"; $path ) ]
Set Field [ test::output ; MBS( "CGImageSource.ThumbnailAtIndex"; $img; 0; "JPEG"; "thumbnail.jpg" ) ]
```

Set Variable [\$r ; Value: MBS("CGImageSource.Release"; \$img)]

49.19 CGImageSource.Type

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
49 CGImageSource	3.4	Yes	No	Yes, macOS only	No	Yes

MBS("CGImageSource.Type"; Ref)

Parameters

Ref

The image source reference number returned by CGImageSource.CreateWithData, CGImageSource.CreateWithPath or CGImageSource.CreateWithURL
\$ref

Result Returns type string or error message.

Description

e.g. "public.jpeg" for a jpeg image.

Examples

Query type:

```
MBS( "CGImageSource.Type"; $ref )
```

Load image from container and query type:

```
Set Variable [ $img ; Value: MBS( "CGImageSource.CreateWithData"; test::input ) ]
Show Custom Dialog [ "Type" ; MBS( "CGImageSource.Type"; $img ) ]
Set Variable [ $r ; Value: MBS( "CGImageSource.Release"; $img ) ]
```

Chapter 50

CLGeocoder

Functions for geo coordinate lookup.

You can lookup your clients addresses, store the coordinates and later find records close to a given address.

50.1 CLGeocoder.Cancel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.Cancel"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns OK or error.

Description

You can use this method to cancel a pending request and free up the resources associated with that request.

Canceling a pending request causes the completion handler block to be called.

If the request is not pending, because it has already returned or has not yet begun, this method does nothing.

See also

- 50.2 CLGeocoder.Cancelled 1417
- 50.3 CLGeocoder.Close 1418
- 50.4 CLGeocoder.Distance 1419
- 50.5 CLGeocoder.Done 1421

50.2 CLGeocoder.Cancelled

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.Cancelled"; Geocoder)

Parameters

Geocoder

The reference to the geocoder

\$Geocoder

Result Returns 0, 1 or error.

Description

See also

- 50.1 CLGeocoder.Cancel

1415

Created 18th August 2014, last changed 18th August 2014.

50.3 CLGeocoder.Close

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.Close"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns OK or error.

Description

Call this to close the request.

See also

Example Databases

- [Mac and iOS/CoreLocation/Address Mapping](#)
- [Mac and iOS/CoreLocation/CLGeocoder](#)

50.3.1 Blog Entries

- [Core Location Geocoder with JSON](#)

Created 18th August 2014, last changed 18th August 2014.

50.4 CLGeocoder.Distance

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	6.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.Distance"; latitude1; longitude1; latitude2; longitude2)

Parameters

latitude1

The latitude value for the geo coordinate.
51.50939

longitude1

The latitude value for the geo coordinate.
-0.11832

latitude2

The latitude value for the geo coordinate.
52.518611

longitude2

The latitude value for the geo coordinate.
13.408333

Result Returns OK or error.

Description

This method measures the distance between the two locations by tracing a line between them that follows the curvature of the Earth. The resulting arc is a smooth curve and does not take into account specific altitude changes between the two locations.

Examples

Returns distance between London and Berlin:

MBS("CLGeocoder.Distance"; 51.50939; -0.11832; 52.518611; 13.408333)

50.5 CLGeocoder.Done

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.Done"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns 0, 1 or error.

Description

You can use CLGeocoder.Error to see if an error happened.

Or use CLGeocoder.PlacemarkCount to find out how many placemarks were found.

Created 18th August 2014, last changed 18th August 2014.

50.6 CLGeocoder.Error

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.Error"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns 0, 1 or error.

Description

Returns 1 if an error occurred. You can use CLGeocoder.ErrorMessage to get the error message.

Examples

Checks error and shows message:

```
If [ MBS( "CLGeocoder.Error"; $g ) ]
  Display Dialog [ "Error"; MBS( "CLGeocoder.ErrorMessage"; $g ) ]
End If
```

See also

- [50.5 CLGeocoder.Done](#) 1421
- [50.7 CLGeocoder.ErrorMessage](#) 1423

Example Databases

- [Mac and iOS/CoreLocation/Address Mapping](#)
- [Mac and iOS/CoreLocation/CLGeocoder](#)

Created 18th August 2014, last changed 18th August 2014.

50.7 CLGeocoder.ErrorMessage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.ErrorMessage"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns text or error.

Description

Examples

Checks error and shows message:

```
If [ MBS( "CLGeocoder.Error"; $g ) ]
Display Dialog [ "Error"; MBS( "CLGeocoder.ErrorMessage"; $g ) ]
End If
```

See also

Created 18th August 2014, last changed 18th August 2014.

50.8 CLGeocoder.GeocodeAddressString

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

```
MBS( "CLGeocoder.GeocodeAddressString"; Address { ; wait } )
```

Parameters

Address

A string describing the location you want to look up. For example, you could specify the string "1 Infinite Loop, Cupertino, CA" to locate Apple headquarters. "Andernach, Germany"

wait

Optional

Available in MBS FileMaker Plugin 10.1 or newer.

Pass 1 to wait for geocoder to have a result. Pass 0 to not wait and check later if geocoder is done.

1

Result Returns reference number or error.

Description

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a forward-geocoding request, do not attempt to initiate another forward- or reverse-geocoding request.

Geocoding requests are rate-limited for each app, so making too many requests in a short period of time may cause some of the requests to fail. When the maximum rate is exceeded, the geocoder passes an error back.

You need to use CLGeocoder.Close later to free the geocoder.

Examples

Geocodes an address:

```
$r = MBS("CLGeocoder.GeocodeAddressString"; CLGeocoder::AddressString)
```

Query in one let statement and return JSON or error:

```
Let ( [
  Address = "Berlin, Germany";
  // run query and wait a bit
  g = MBS( "CLGeocoder.GeocodeAddressString"; Address; 1 );
  e = MBS("IsError");
  // query JSON if we got something
  r = If (e = 0; MBS( "CLGeocoder.JSON"; g ); g);
  // free resources
  f = If (e = 0; MBS( "CLGeocoder.Close"; g ); 0)
]; r )
```

50.8. *CLGEOCODER.GEOCODEADDRESSSTRING* 1425

Created 18th August 2014, last changed 12nd February 2020.

50.9 CLGeocoder.JSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	10.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.JSON"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns JSON or error.

Description

This includes status variables, the error dictionary with details in case of error and the array of place marks with details for a place mark including location, address text and time zone for the location.

Examples

Query in one let statement and return JSON or error:

```
Let ( [
Address = "Berlin, Germany";
// run query and wait a bit
g = MBS( "CLGeocoder.GeocodeAddressString"; Address; 1 );
e = MBS("IsError");
// query JSON if we got something
r = If ( e = 0; MBS( "CLGeocoder.JSON"; g ); g );
// free resources
f = If ( e = 0; MBS( "CLGeocoder.Close"; g ); 0 )
]; r )
```

Run query and get back JSON or error:

```
Let ( [
latitude = 52.517631899999998;
longitude = 13.4096574;
// run query and wait a bit
g = MBS( "CLGeocoder.ReverseGeocodeLocation"; latitude; longitude; 1 );
e = MBS("IsError");
// query JSON if we got something
r = If ( e = 0; MBS( "CLGeocoder.JSON"; g ); g );
// free resources
f = If ( e = 0; MBS( "CLGeocoder.Close"; g ); 0 )
]; r )
```

50.10 CLGeocoder.PlacemarkCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.PlacemarkCount"; Geocoder)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Result Returns count or error.

Description

Examples

Queries placemark count:

MBS("CLGeocoder.PlacemarkCount"; \$g)

See also

- 50.5 CLGeocoder.Done 1421
- 50.11 CLGeocoder.PlacemarkValue 1429

Example Databases

50.11 CLGeocoder.PlacemarkValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.PlacemarkValue"; Geocoder; Index; Selector; otherLatitude; otherLongitude)

Parameters

Geocoder

The reference number of the geocoder instance.

\$Geocoder

Index

The index of the placemark. From 0 to CLGeocoder.PlacemarkCount-1.

0

Selector

Which property to return.

"Name"

otherLatitude

For distance calculation the latitude of the other place.

\$lat

otherLongitude

For distance calculation the longitude of the other place.

\$lon

Result Returns value or error.

Description

Possible values for selector:

Examples

Query name of the first placemark:

```
$name = MBS("CLGeocoder.PlacemarkValue"; $g; 0; "name")
```

Queries the coordinates of the placemark:

```
$latitude = MBS("CLGeocoder.PlacemarkValue"; $g; 0; "location.latitude")
```

```
$longitude = MBS("CLGeocoder.PlacemarkValue"; $g; 0; "location.longitude")
```

Queries distance to New York:

```
$distance = MBS("CLGeocoder.PlacemarkValue"; $g; 0; "distance"; 40,712778; -74,005833)
```

50.11.1 Blog Entries

- [MBS FileMaker Plugin, version 8.6pr2](#)

Created 18th August 2014, last changed 18th August 2014.

name	The name of the placemark.
thoroughfare	The street address associated with the placemark. The street address contains the street name. For example, if the placemark location is Apple's headquarters, the value for this property would be the string "Infinite Loop".
subThoroughfare	Additional street-level information for the placemark. Subthroughfares provide information such as the street number for the location. For example, if the placemark location is Apple's headquarters (1 Infinite Loop), the value for this property would be the string "1".
locality	The city associated with the placemark. If the placemark location is Apple's headquarters, for example, the value for this property would be the string "Cupertino".
subLocality	Additional city-level information for the placemark. This property contains additional information, such as the name of the neighborhood or landmark associated with the placemark. It might also refer to a common name that is associated with the location.
administrativeArea	The state or province associated with the placemark. The string in this property can be either the spelled out name of the administrative area or its designated abbreviation, if one exists. If the placemark location is Apple's headquarters, for example, the value for this property would be the string "CA" or "California".
subAdministrativeArea	Additional administrative area information for the placemark. Subadministrative areas typically correspond to counties or other regions that are then organized into a larger administrative area or state. For example, if the placemark location is Apple's headquarters, the value for this property would be the string "Santa Clara", which is the county in California that contains the city of Cupertino.
postalCode	The postal code associated with the placemark. If the placemark location is Apple's headquarters, for example, the value for this property would be the string "95014".
ISOcountryCode	The abbreviated country name. This string is the standard abbreviation used to refer to the country. For example, if the placemark location is Apple's headquarters, the value for this property would be the string "US".
country	The name of the country associated with the placemark. If the placemark location is Apple's headquarters, for example, the value for this property would be the string "United States".
inlandWater	The name of the inland water body associated with the placemark. For coordinates that lie over an inland body of water, this property contains the name of that water body—the name of a lake, stream, river, or other waterway.
ocean	The name of the ocean associated with the placemark. For coordinates that lie over an ocean, this property contains the name of the ocean.
areasOfInterest	The relevant areas of interest associated with the placemark. Examples of an area of interest are the name of a military base or large national park or an attraction such as Eiffel Tower, Disneyland, or Golden Gate Park. This is a list of several texts.
region.radius	The radius of the geographic region associated with the placemark.
region.center.latitude	The latitude of the geographic region associated with the placemark.
region.center.longitude	The longitude of the geographic region associated with the placemark.
region.identifier	The identifier of the geographic region associated with the placemark.
address	The formatted address.
location.horizontalAccuracy	The horizontal accuracy of the location.
location.verticalAccuracy	The vertical accuracy of the location.
location.altitude	The altitude of the location.
location.timestamp	The timestamp of the location.
location.description	The description text of the location.
location.latitude	The latitude of the location.
location.longitude	The longitude of the location.
distance	Calculates the distance to another location. Please provide the other place with additional parameters. Returns value in meters.

50.12 CLGeocoder.ReverseGeocodeLocation

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
50 CLGeocoder	4.1	Yes	No	Yes, macOS only	No	Yes

MBS("CLGeocoder.ReverseGeocodeLocation"; latitude; longitude { ; wait })

Parameters

latitude

The latitude of the coordinate.

longitude

The longitude of the coordinate.

wait

Optional

Available in MBS FileMaker Plugin 10.1 or newer.

Pass 1 to wait for geocoder to have a result. Pass 0 to not wait and check later if geocoder is done.

1

Result Returns reference number or error.

Description

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a reverse-geocoding request, do not attempt to initiate another reverse- or forward-geocoding request.

Geocoding requests are rate-limited for each app, so making too many requests in a short period of time may cause some of the requests to fail. When the maximum rate is exceeded, the geocoder passes an error back.

You need to use CLGeocoder.Close later to free the geocoder.

CoreLocation Geocoder reference numbers are starting at 24000 and counting up for each new geocoder.

Examples

Reverse geocode location:

```
MBS("CLGeocoder.ReverseGeocodeLocation"; CLGeocoder::Latitude; CLGeocoder::Longitude)
```

Run query and get back JSON or error:

```
Let ( [
latitude = 52.517631899999998;
longitude = 13.4096574;
// run query and wait a bit
g = MBS( "CLGeocoder.ReverseGeocodeLocation"; latitude; longitude; 1 );
e = MBS("IsError");
// query JSON if we got something
r = If (e = 0; MBS( "CLGeocoder.JSON"; g ); g);
// free resources
f = If (e = 0; MBS( "CLGeocoder.Close"; g ); 0)
```

50.12. *CLGEOCODER.REVERSEGEOCODELOCATION* 1433
]; r)

Created 18th August 2014, last changed 12nd February 2020.

Chapter 51

Clipboard

Get and set clipboard text.

51.1 Clipboard.DetectFileMakerDataType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	10.1	Yes	Yes	Yes	No	No

MBS("Clipboard.DetectFileMakerDataType"; XML Text)

Parameters

XML Text

The xml text to put on the clipboard.

\$text

Result Returns text or error.

Description

Returns the type as text: ValueList, Script, ScriptStep, Layout, CustomFunction, Table, Field or Layout12.

51.1.1 Blog Entries

- [MBS FileMaker Plugin, version 10.1pr5](#)

Created 21st February 2020, last changed 21st February 2020.

51.2 Clipboard.GetData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	4.4	Yes	Yes	No	No	Yes

MBS("Clipboard.GetData"; ClipboardType; ResultType { ; Param1; Param2 })

Parameters

ClipboardType

The clipboard type to query. On Windows can also be a number.

"com.apple.icns"

ResultType

How to return the data. Can be "hex" for hex encoded, "base64" for base 64 encoded, "text" for trying to read data as text, "file" for a container value containing a file or "image" for reading data as image.

"image"

Param1

Optional

For ResultType "file" the filename of the container value. For ResultType "image" the image type. Can be PNG, JPEG, GIF or BMP.

"JPEG"

Param2

Optional

For ResultType "image", the file name of the image in the container value.

"image.jpg"

Result Returns OK or error.

Description

We look at the clipboard for a matching item with given type and return it in the format type you request.

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Examples

Queries icon from clipboard:

```
MBS("Clipboard.GetData"; "com.apple.icns"; "image")
```

51.3 Clipboard.GetFileMakerData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	4.0	Yes	Yes	No	No	No

MBS("Clipboard.GetFileMakerData"; Type)

Parameters

Type

What element type to query. Can be "auto" for version 10.1 for automatic type selection.
"Layout"

Result Returns text or error.

Description

The result is a XML text which you can store for later.

The type can be ValueList, Script, ScriptStep, Layout, CustomFunction, Table, Field or Layout12.

Pass auto as type in version 10.1 or newer to let the plugin look for all types and return the data found.

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Added type ValueList for FileMaker 16.

For custom menus in FileMaker 17, please use Clipboard.GetText function.

Warning: Some settings in script step for import, export or printer setup may not be preserved in copied content!

51.4 Clipboard.GetFiles

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	5.1	Yes	Yes	No	No	Yes

MBS("Clipboard.GetFiles")

Result Returns list or error.

Description

If you copy files in Finder or Explorer, you can use this plugin function to get a list of files. Returns native file paths, so you may need Path.NativePathToFileMakerPath function.

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Examples

Query list of files:

MBS("Clipboard.GetFiles")

51.5 Clipboard.GetHTMLText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	6.0	Yes	Yes	No	No	Yes

MBS("Clipboard.GetHTMLText" { ; Encoding })

Parameters

Encoding

Optional

The text encoding for result. Default is Windows ANSI.

UTF8

Result Returns html text or error.

Description

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

For Mac OS X, if a webarchive is on the clipboard, the plugin will pick data from that webarchive. Safari puts a Webarchive on the clipboard if you do a copy to the clipboard. If text encoding is UTF-8, the plugin will automatically use this encoding as default unless you overwrite it.

51.6 Clipboard.GetPicture

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	6.3	Yes	Yes	No	No	Yes

MBS("Clipboard.GetPicture" { ; ImageType; Filename })

Parameters

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Result Returns image or error.

Description

You can store image in a container field for example.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	5.0	Yes	Yes	No	No	Yes

MBS("Clipboard.GetRTFText" { ; Encoding })

Parameters

Encoding

Optional

The text encoding for result. Default is Windows ANSI.

UTF8

Result Returns text or error.

Description

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

51.9 Clipboard.GetText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	2.6	Yes	Yes	No	No	Yes

MBS("Clipboard.GetText" { ; type })

Parameters

type

Optional

The data type. By default NSStringPboardType, but can be other Mac types. Mac only.

””

Result The text from the clipboard. Empty if no text is there.

Description

Examples for type parameter: public.utf8-plain-text, CorePasteboardFlavorType 0x54455854, public.rtf,CorePasteboardFlavorType 0x75747874.

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Examples

Get text from clipboard:

```
MBS("Clipboard.GetText")
```

Query addressbook data from Contacts app:

```
MBS("Clipboard.GetText"; "ABPeopleDictPboardType")
```

Get design from clipboard after copying it in FileMaker:

```
MBS("Clipboard.GetText"; "dyn.agk8u")
```

51.10 Clipboard.GetTypes

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	4.0	Yes	Yes	No	No	Yes

MBS("Clipboard.GetTypes")

Result Returns list or error.

Description

The plugin currently only get/set unicode text using Clipboard.GetText/Clipboard.SetText. If you need additional data types supported, please contact us.

For server this will query the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Examples

Query list of types:

MBS("Clipboard.GetTypes")

See also

51.11 Clipboard.SetFileMakerData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	4.0	Yes	Yes	No	No	No

MBS("Clipboard.SetFileMakerData"; Type; Text)

Parameters

Type

What element type to set. Can be "auto" for version 10.1 for automatic type selection.
"Layout"

Text

The text to put on the clipboard.
\$text

Result Returns OK or error.

Description

Be sure to put the correct xml on the clipboard to avoid FileMaker being confused.
The type can be ValueList, Script, ScriptStep, Layout, CustomFunction, Table, Field or Layout12.
Pass auto as type in version 10.1 or newer to let the plugin look at the xml to decide on type.

For server this will modify the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Added type ValueList for FileMaker 16.
For custom menus in FileMaker 17, please use Clipboard.SetText function.

Examples

Put xml back on clipboard:

```
Set Variable [ $r; Value: MBS( "Clipboard.SetFileMakerData"; "auto"; $xml ) ]
```

51.12 Clipboard.SetFiles

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	5.1	Yes	Yes	No	No	Yes

MBS("Clipboard.SetFiles"; Paths)

Parameters

Paths

The list of file paths.

"C:\Users\Christian\Desktop\Jaguar Aqua Graphite.jpg"

Result Returns OK or error.

Description

For server this will modify the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

Examples

Put a file path to clipboard on Windows:

```
MBS("Clipboard.SetFiles"; "C:\Users\Christian\Desktop\test.fmp12")
```

Put two file paths on clipboard on Windows:

```
MBS("Clipboard.SetFiles"; "C:\Users\Christian\Desktop\test.fmp12&C:\Users\Christian\Desktop\Jaguar Aqua Graphite.jpg")
```

Put a file path on clipboard on Mac:

```
MBS("Clipboard.SetFiles"; "/Users/cs/Desktop/todo.rtf")
```

51.13 Clipboard.SetHTMLText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	6.0	Yes	Yes	No	No	Yes

```
MBS( "Clipboard.SetHTMLText"; HTMLText { ; Encoding } )
```

Parameters

HTMLText

The html data to put in clipboard.

```
"<p>Hello</p>" \f0\b\fs28 \cf0 Hello World }
```

Encoding

Optional

The text encoding for text parameter. Default is Windows ANSI.

UTF8

Result Returns OK or error.

Description

For server this will modify the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

On Windows you may want to use Text.ReplaceNewline first to convert line endings. FileMaker on Windows uses Mac line endings internally.

Examples

Put some HTML on clipboard:

```
MBS( "Clipboard.SetHTMLText"; "<b>Hello</b>"; "UTF8")
```

51.14 Clipboard.SetPicture

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	6.3	Yes	Yes	No	No	Yes

MBS("Clipboard.SetPicture"; Image)

Parameters

Image

The container with image. Can be in various formats including JPEG, PNG, TIFF and BMP.
MyTable::myContainer

Result Returns OK or error.

Description

Examples

Put image on clipboard:

```
MBS( "Clipboard.SetPicture";  
MBS( "Container.ReadFile"; "/Users/cs/Pictures/IMG_3625.jpg"; "auto" ) )
```

51.15 Clipboard.SetRTFText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	5.0	Yes	Yes	No	No	Yes

MBS("Clipboard.SetRTFText"; RTFText { ; Encoding })

Parameters

RTFText

The RTF data to put in clipboard.

```
" { \rtf1\ansi\ansicpg1252\cocoartf1265\cocoasubrtf210 \cocoascreenfonts1 { \fonttbl\f0\fswiss\fcharset0
Helvetica; } { \colortbl;\red255\green255\blue255; } \pard\tx560\tx1120\tx1680\tx2240\tx2800\tx3360\tx3920\tx4480\tx5040\tx5600\tx6160\tx6720\pardirnatural
```

```
\f0\b\fs28 \cf0 Hello World } "
```

Encoding

Optional

The text encoding for text parameter. Default is Windows ANSI.

UTF8

Result Returns OK or error.

Description

See also Text.TextToRTF to convert formatted text to RTF.

For server this will modify the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

On Windows you may want to use Text.ReplaceNewline first to convert line endings. FileMaker on Windows uses Mac line endings internally.

Examples

Put text on clipboard:

```
MBS( "Clipboard.SetRTFText"; " { \rtf1\ansi\ansicpg1252\cocoartf1265\cocoasubrtf210
\cocoascreenfonts1 { \fonttbl\f0\fswiss\fcharset0 Helvetica; }
{ \colortbl;\red255\green255\blue255; }
\pard\tx560\tx1120\tx1680\tx2240\tx2800\tx3360\tx3920\tx4480\tx5040\tx5600\tx6160\tx6720\pardirnatural
\f0\b\fs28 \cf0 Hello World } "; "UTF8" )
```

Created 17th November 2014, last changed 26th December 2019.

51.16 Clipboard.SetStyledText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	5.0	Yes	No	No	No	Yes

MBS("Clipboard.SetStyledText"; Text)

Parameters

Text

The styled text to put in clipboard.

"Hello World"

Result Returns OK or error.

Description

This is direct way for styled text without converting in-between to RTF.

For Windows or cross platform solutions you can combine `Text.TextToRTF` and `Clipboard.SetRTFText`.

For server this will modify the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

Examples

Put red text on the clipboard:

```
MBS( "Clipboard.SetStyledText"; TextColor ( "Hello World" ; RGB ( 65535 ; 0 ; 0 ) ) )
```

See also

- 51.8 `Clipboard.GetStyledText` 1444

51.17 Clipboard.SetText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
51 Clipboard	2.6	Yes	Yes	No	No	Yes

```
MBS( "Clipboard.SetText"; text { ; type } )
```

Parameters

text

The new txt for the clipboard.

"Hello World"

type

Optional

The data type. By default NSStringPboardType, but can be other Mac types.

""

Result Returns "OK" or error message.

Description

For server this will modify the clipboard of the user account running the server app on the server computer and not the clipboard of any client.

On Windows you may want to use Text.ReplaceNewline first to convert line endings. FileMaker on Windows uses Mac line endings internally.

If called on WebDirect, the plugin puts text on the clipboard for the server, not for the client! So the functions are of no use on server.

Examples

Sets text:

```
MBS( "Clipboard.SetText"; "Hello World" )
```

Chapter 52

ColorPanel

Functions for Color Panels

On Windows, can show only a dialog. For MacOS, we can show color palette.

52.1 ColorPanel.Choose

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
52 ColorPanel	8.3	No	Yes	No	No	No

MBS("ColorPanel.Choose"; Color)

Parameters

Color

The color to prefill.

Result Returns color, Cancel or error.

Description

If you pass a color, it's preselected.

Versions until 8.5 return OK when cancel was selected. This was corrected for 9.0.
Windows may not select the given color if it doesn't like to.

Examples

Choose color:

```
MBS( "ColorPanel.Choose"; "# FF0000")
```

See also

- 52.9 ColorPanel.Show

Example Databases

Created 13th June 2018, last changed 1st January 2019.

52.2 ColorPanel.GetColor

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
52 ColorPanel	8.3	Yes	No	No	No	No

MBS("ColorPanel.GetColor" { ; ReturnAsNumbers })

Parameters

ReturnAsNumbers

Optional

Pass 1 to return color as list of red, green and blue, e.g. "123§234§56" Pass 0 (default) for return as hex value, e.g. "7788FF".

0

Result Returns color or error.

Description

Returns color as hex values, e.g. FF0000 for red.

Examples

Query color:

```
Set Variable [ $c ; Value: MBS( "ColorPanel.GetColor" ) ]
If [ MBS("IsError") = 0 ]
Set Field [ Color Panel::Color ; "# " & $c ]
End If
```

Example Databases

- [Color Panel](#)

Created 13th June 2018, last changed 13th June 2018.

52.6 ColorPanel.SetColor

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
52 ColorPanel	8.3	Yes	No	No	No	No

MBS("ColorPanel.SetColor"; color)

Parameters

color

A color value. This can be a common color name or color in hex notation: # followed by 2 digits for red, green, blue and optional alpha, e.g. # FF0000 for full red.

"# FF0000"

Result Returns OK or error.

Description

Examples

Set red:

MBS("ColorPanel.SetColor"; "# FF0000")

Created 13th June 2018, last changed 19th September 2019.

52.7 ColorPanel.SetColorChangedEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
52 ColorPanel	8.3	Yes	No	No	No	No

MBS("ColorPanel.SetColorChangedEvaluate")

Result Returns OK or error.

Description

The plugin can evaluate this expression to set variables, call plugin functions to trigger other things. Use ColorPanel.GetColor to query new color.

See also

- 52.2 ColorPanel.GetColor 1463
- 52.3 ColorPanel.GetColorChangedEvaluate 1464
- 52.4 ColorPanel.GetColorChangedScript 1465
- 52.8 ColorPanel.SetColorChangedScript 1469

Created 13th June 2018, last changed 13th June 2018.

52.8 ColorPanel.SetColorChangedScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
52 ColorPanel	8.3	Yes	No	No	No	No

MBS("ColorPanel.SetColorChangedScript"; Filename; ScriptName { ; Parameter })

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Parameter

Optional

Script parameter to pass.

Result Returns OK or error.

Description

You may need to clear this to disable the plugin from triggering script while in layout mode until version 8.4, where we don't call trigger in layout mode.

Examples

Set color changed script trigger:

```
Set Variable [ $r ; Value: MBS( "ColorPanel.SetColorChangedScript"; Get(Filename); "ColorChanged" ) ]
```

Clear script trigger:

```
MBS( "ColorPanel.SetColorChangedScript"; ""; "" )
```

52.9 ColorPanel.Show

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
52 ColorPanel	8.3	Yes	No	No	No	No

MBS("ColorPanel.Show")

Result Returns OK or error.

Description

Examples

Show panel and optionally load a color:

```
Set Variable [ $r ; Value: MBS( "ColorPanel.SetColorChangedScript"; Get(FileName); "ColorChanged" ) ]
If [ Length ( Color Panel::Color ) >0 ]
Set Variable [ $r ; Value: MBS( "ColorPanel.SetColor"; Color Panel::Color ) ]
End If
Set Variable [ $r ; Value: MBS( "ColorPanel.Show" ) ]
```

Chapter 53

Compression

Functions to handle Zip and gzip files.

Please use Archive functions for newer projects.

53.1 GZipFile.Compress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	4.2	Yes	Yes	Yes	Yes	Yes

MBS("GZipFile.Compress"; InputPath; OutputPath)

Parameters

InputPath

The native path to the input file.

"C:\test.txt"

OutputPath

The native path to the input file.

"C:\test.gz"

Result Returns OK or error.

Description

This function uses gzip file format, so please use file extension .gz. Maximum compression is used.

As this function processes file in chunks it should work fine with huge files.

In case of an error like a full hard disk, you need to manually delete the half written output file.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Compress a file:

```
MBS( "GZipFile.Compress"; "C:\test.txt"; "C:\test.gz" )
```

See also

- 53.2 GZipFile.Decompress 1475
- 121.2 Path.FileMakerPathToNativePath 6139

Created 18th August 2014, last changed 5th September 2014.

53.2 GZipFile.Decompress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	4.2	Yes	Yes	Yes	Yes	Yes

MBS("GZipFile.Decompress"; InputPath; OutputPath)

Parameters

InputPath

The native path to the input file.

"C:\test.gz"

OutputPath

The native path to the input file.

"C:\test.txt"

Result Returns OK or error.

Description

This function uses gzip file format, so please use file extension .gz.

As this function processes file in chunks it should work fine with huge files.

In case of an error like a full hard disk, you need to manually delete the half written output file.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Uncompress a file:

MBS("GZipFile.Decompress"; "C:\test.gz"; "C:\test.txt")

See also

- 53.1 GZipFile.Compress 1473
- 121.2 Path.FileMakerPathToNativePath 6139

Created 18th August 2014, last changed 5th September 2014.

53.3 UnZipFile.Close

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.Close")

Result Returns OK or error.

Description

Examples

Close file

MBS("UnZipFile.Close")

See also

- [53.4 UnZipFile.ExtractFiles](#) 1477
- [53.34 ZipFile.Close](#) 1510

Example Databases

- [Zip/Show Zip File Content](#)

53.3.1 FileMaker Magazin

- Ausgabe 6/2013, Seite 33
- Ausgabe 6/2013, Seite 31

Created 18th August 2014, last changed 18th August 2014.

53.4 UnZipFile.ExtractFiles

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	6.0	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ExtractFiles"; destFolder { ; ExtractWithoutPath; Overwrite })

Parameters

destFolder

The native path to the destination folder. Please make sure this folder exists.

"/Users/cs/Desktop/test"

ExtractWithoutPath

Optional

If 1, all files are put in one folder and no subfolders are created.

0

Overwrite

Optional

Pass 1 to allow files to be overwritten. Default is 0 to not overwrite.

Result Returns OK or error.

Description

Please use UnZipFile.OpenContainer and UnZipFile.OpenFile to open the archive first.

This function does not restore file permissions or other metadata. And it may not work with non ASCII characters.

If you need more control over files being extracted, stored or error checking, please check example database coming with plugin.

Deprecated. Please use Archive.Extraxct for new projects.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Opens archive and expands files:

```
Set Variable [ $r; Value:MBS( "UnZipFile.OpenFile"; "/Users/cs/Desktop/test.zip" ) ]
If [ $r = "OK" ]
Set Variable [ $r; Value:MBS( "UnZipFile.ExtractFiles"; "/Users/cs/Desktop/test"; 0 ) ]
Set Variable [ $r; Value:MBS( "UnZipFile.Close" ) ]
End If
```

Expand files on Windows:

```
Set Variable [ $r; Value:MBS( "UnZipFile.OpenFile"; "C:\Users\Christian\Desktop\DebugView.zip" ) ]  
If [ $r = "OK" ]  
Set Variable [ $r; Value:MBS( "UnZipFile.ExtractFiles"; "C:\Users\Christian\Desktop\test"; 0 ) ]  
Set Variable [ $r; Value:MBS( "UnZipFile.Close" ) ]  
End If
```

53.5 UnZipFile.GlobalComment

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.GlobalComment" { ; Encoding })

Parameters

Encoding

Optional

The text encoding for result. Default is native.

UTF8

Result Returns text or error.

Description

Examples

Query the global comment:

MBS("UnZipFile.GlobalComment")

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemCRC"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.
\$index

Result Returns checksum number or error.

Description

See also

- [53.10 UnZipFile.ItemCount](#) 1484

53.7 UnZipFile.ItemComment

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemComment"; Index { ; Encoding })

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.

\$index

Encoding

Optional

The text encoding for result. Default is native.

"UTF8"

Result Returns comment as text or error.

Description

See also

- [53.5 UnZipFile.GlobalComment](#) 1479

53.8 UnZipFile.ItemCompressedSize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemCompressedSize"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.

\$index

Result Returns size as number or error.

Description

Examples

Queries sizes:

```
$UncompressedSize = MBS( "UnZipFile.ItemUncompressedSize"; 0 )
```

```
$CompressedSize = MBS( "UnZipFile.ItemCompressedSize"; 0 )
```

```
$PercentSaved = ($UncompressedSize - $CompressedSize) / $UncompressedSize
```

53.9 UnZipFile.ItemCompressionMethod

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemCompressionMethod"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.

\$index

Result Returns number or error.

Description

Can be 0 for no compression and 1 for deflate compression.

Any other value is not supported by the plugin.

See also

53.12 UnZipFile.ItemDiskNumberStart

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemDiskNumberStart"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.
\$index

Result Returns number or error.

Description

See also

- [53.10 UnZipFile.ItemCount](#) 1484

Example Databases

- [Zip/Show Zip File Content](#)

Created 18th August 2014, last changed 18th August 2014.

53.13 UnZipFile.ItemExternalFileAttributes

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemExternalFileAttributes"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.

\$index

Result Returns number or error.

Description

See also

- [53.10 UnZipFile.ItemCount](#) 1484
- [53.15 UnZipFile.ItemInternalFileAttributes](#) 1490

Example Databases

- [Zip/Show Zip File Content](#)

53.14 UnZipFile.ItemFlag

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemFlag"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.

\$index

Result Returns number or error.

Description

The flag is a bit field with various values.

Last bit of the flag is encryption state: value is 1 (odd) for encrypted and 0 (even) for unencrypted value.

The bit values 2 and 4 define compression level between 0 to 9.

Flag Value	Encryption	Compression Level
0	no	6
1	yes	6
2	no	9
3	yes	9
4	no	2
5	yes	2
6	no	1
7	yes	1

Examples

Check compressed state:

```
Set Variable [ $compressed; Value: MBS( "Math.BitwiseAND"; MBS( "UnZipFile.ItemFlag"; Index ); 1 ) = 1 ]
```

53.16 UnZipFile.ItemName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ItemName"; Index { ; Encoding })

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.
\$index

Encoding

Optional
The text encoding for result. Default is native.
"UTF8"

Result Returns name or error.

Description

Can include folder names and slash as separator.

The plugin reads the directory so you can use UnZipFile.ItemCount function to learn the number of items.

Deprecated. Please use Archive.Compress for new projects.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Open archive on Windows:

```
MBS( "UnZipFile.OpenFile"; "c:\folder\test.zip" )
```

Open Archive and expand:

```
MBS( "UnZipFile.OpenFile"; "C:\Users\Christian\Desktop\MBSFMPlugins153.zip")
```

```
MBS( "UnZipFile.ExtractFiles"; "C:\Users\Christian\Desktop\test")
```

53.25 UnZipFile.ReadAsFileContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.ReadAsFileContainer"; Index)

Parameters

Index

Index of the item from 0 to UnZipFile.ItemCount-1.

\$index

Result Returns container value or error.

Description

If you want to decrypt an encrypted file, please use UnZipFile.UsePassword before calling this function.

Examples

Read file:

```
$r = MBS( "UnZipFile.ReadAsFileContainer"; $Index )
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	5.1	Yes	Yes	Yes	No	Yes

MBS("UnZipFile.UsePassword"; Password { ; Encoding })

Parameters

Password

The password text.

"pass123"

Encoding

Optional

The text encoding for password parameter. Default is native.

"native"

Result Returns OK or error.

Description

The password is needed to open encrypted files in archive.

Each item in archive could have its own password, but normally all have the same.

53.33 ZipFile.CRCFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	4.3	Yes	Yes	Yes	No	Yes

MBS("ZipFile.CRCFile"; Path)

Parameters

Path

Native file path.

\$path

Result Returns CRC as number.

Description

This is same CRC as used in zip files.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Calculate CRC of a file:

```
MBS( "ZipFile.CRCFile"; "C:\test.txt" )
```

53.35 ZipFile.CompressFiles

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	6.0	Yes	Yes	Yes	No	Yes

MBS("ZipFile.CompressFiles"; SourceFolder; ZipFilePath; FileList; Overwrite; CompressionLevel)

Parameters

SourceFolder

The native file path to the source folder for files to compress.

"/Users/cs/Desktop/test"

ZipFilePath

The native file path to the zip archive.

"/Users/cs/Desktop/test.zip"

FileList

The list of relative file names to compress. Please only ASCII file names.

"image1.jpg\$image2.jpg"

Overwrite

Whether to overwrite the zip archive. Pass 0 to not overwrite an existing file. Pass 1 to overwrite. Pass 2 to append to a zip file.

1

CompressionLevel

The compress level from 0 (no compression) to 9 (max compression). Default is 9.

9

Result Returns OK or error.

Description

This is a simple function to compress a couple of files.

It does not preserve file permissions on Mac/Linux or other metadata.

And it may not work with non ASCII characters. We use UTF-8 on Mac/Linux/iOS, but there is no guarantee that this will work.

If you need more control over files being added, compression or error checking, please use example projects coming with plugin which use our other zip functions. Or use the shell functions and the zip command line tool.

Deprecated. Please use Archive.Compress for new projects.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Compresses some image files:

```
# first get list of file names in folder:
Set Variable [ $list; Value:MBS( "Files.List"; "/Users/cs/Pictures/TestFiles" ) ]
# now compress them:
Set Variable [ $r; Value:MBS( "ZipFile.CompressFiles"; "/Users/cs/Pictures/TestFiles"; "/Users/cs/Desktop/test.zip"; $list; 0; 9 ) ]
```

Compress some images on Windows:

```
MBS( "ZipFile.CompressFiles"; "C:\Users\Administrator\Documents"; "C:\Users\Administrator\Desktop\test.zip";
"MBSLogo100.png$test.png$other.jpg"; 0; 9 )
```

Zip a file on Mac:

```
MBS( "ZipFile.CompressFiles"; "/Users/cs/Desktop"; "/Users/cs/Desktop/Kontakte.zip"; "Kontakte.fmp12";
1; 9 )
```

53.36 ZipFile.CreateFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("ZipFile.CreateFile"; filename; date { ; Comment; Encoding; zip64 })

Parameters

filename

The filename to use. Can include path information with slashes as delimiter.
"myfolder/test.txt"

date

The file date to use.
Get(CurrentTimestamp)

Comment

Optional
The file comment.
"My first file."

Encoding

Optional
The text encoding for the comment parameter. Default is UTF-8.
UTF8

zip64

Optional
Pass 1 to enable 64-bit zip file. Default is 0 for 32-bit zip file.
0

Result Return OK or error.

Description

Use this method before writing data to the file using ZipFile.WriteContainer or ZipFile.WriteTextFile. Before creating files in archive, you need to open it using ZipFile.Open. If you want to encrypt file, please use ZipFile.UsePassword before calling this function.

Deprecated. Please use Archive.Compress for new projects.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Creates a file:

```
MBS( "ZipFile.CreateFile"; "test.txt"; $date )
```

53.37 ZipFile.Open

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("ZipFile.Open"; Path { ; Mode })

Parameters

Path

Native file path.

\$path

Mode

Optional

The appending mode: 0 to create a new archive (default), 1 create on file end, 2 append to existing archive.

0

Result Returns OK or error.

Description

Deprecated. Please use Archive.Compress for new projects.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Create new archive:

```
MBS( "ZipFile.Open"; "c:\folder\test.zip"; 0 )
```

53.38 ZipFile.SetCompressionLevel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("ZipFile.SetCompressionLevel"; Method; Level)

Parameters

Method

The compression method to use. Can be 0 for no compression and 1 for deflate compression.

1

Level

The compression level from 0 (fastest) to 9 (maximum).

9

Result Returns OK or error message.

Description

By default the plugin uses maximum compression level.

Examples

Set default settings:

MBS("ZipFile.SetCompressionLevel"; 1; 9)

53.39 ZipFile.UsePassword

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	5.1	Yes	Yes	Yes	No	Yes

MBS("ZipFile.UsePassword"; Password { ; Encoding })

Parameters

Password

The password text.

"pass123"

Encoding

Optional

The text encoding for Password parameter. Default is native.

"native"

Result Returns OK or error.

Description

The password is needed to create encrypted files in archive.

Each item in archive could have its own password, but normally all have the same.

Examples

Set password:

```
MBS( "ZipFile.UsePassword"; "Hello" )
```

53.41 ZipFile.WriteFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("ZipFile.WriteFile"; Path)

Parameters

Path

The native file path to the file to read and put into the archive.

\$path

Result Returns OK on success.

Description

Please use ZipFile.CreateFile first to create a new file before writing to it.

This works with all types of files.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Creates a file:

```
MBS( "ZipFile.CreateFile"; "test.txt"; $date )
```

```
MBS( "ZipFile.WriteFile"; "/tmp/test.txt" )
```

53.42 ZipFile.WriteHex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

MBS("ZipFile.WriteHex"; text)

Parameters

text

The text to write.

"48656C6C6F20576F726C64"

Result Returns "OK" on success.

Description

The data is encoded as hex string, so you can pass any byte values as a text. The hex string is decoded before writing.

Please use ZipFile.CreateFile first to create a new file before writing to it.

Examples

Creates a text file:

MBS("ZipFile.CreateFile"; "test.txt"; \$date)

MBS("ZipFile.WriteHex"; "48656C6C6F20576F726C64")

See also

Example Databases

- [Zip/ZipFile](#)

Created 18th August 2014, last changed 18th August 2014.

53.43 ZipFile.WriteText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
53 Compression	3.4	Yes	Yes	Yes	No	Yes

```
MBS( "ZipFile.WriteText"; text { ; Encoding } )
```

Parameters

text

The text to write.

```
"Hello World"
```

Encoding

Optional

The text encoding for text parameter. Default is native.

```
UTF8
```

Result Returns "OK" on success.

Description

This is a way to easily add a text file to a zip archive.

Please use ZipFile.CreateFile first to create a new file before writing to it.

In version 5.0 of the plugin, the parameters are changed and we got an extra unused parameter between function name and text. This was corrected in 5.1pr3.

Examples

Creates a text file:

```
MBS( "ZipFile.CreateFile"; "test.txt"; $date )
MBS( "ZipFile.WriteTextFile"; "Hello World" )
```

Chapter 54

Contacts

The newer Apple API for Addressbook access

For 64-bit MacOS and iOS to work with addressbook and multiple accounts.

54.1 CNContact.AddEmailAddress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddEmailAddress"; ContactIdentifier; Email { ; Label })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Email

The email address.

"test@test.test"

Label

Optional

The label to use. For your convenience we translate iCloud, Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

Result Returns OK or error.

Description

This is a convenience function to add just one email with a given label to the contact.

Please call CNContactStore.UpdateContact later to store the values.

54.2 CNContact.AddInstantMessage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddInstantMessage"; ContactIdentifier; Name; Service { ; Label })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Name

The name of the account.

"Test"

Service

The service for this account. We translate AIM, Facebook, GaduGadu, GoogleTalk, ICQ, Jabber, MSN, QQ, Skype and Yahoo to the right constant for you.

"Facebook"

Label

Optional

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

Result Returns OK or error.

Description

This is a convenience function to add just one instant message account with a given label to the contact.

Please call CNContactStore.UpdateContact later to store the values.

54.3 CNContact.AddInstantMessageJSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddInstantMessageJSON"; ContactIdentifier; Label; JSON)

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Label

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

JSON

The JSON with details

Result Returns OK or error.

Description

This is a convenience function to add just one instant message account with a given label to the contact.

Please call CNContactStore.UpdateContact later to store the values.

The JSON object may contain the keys service and username.

Service can be AIM, Facebook, GaduGadu, GoogleTalk, ICQ, Jabber, MSN, QQ, Skype or Yahoo.

54.4 CNContact.AddPhoneNumber

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddPhoneNumber"; ContactIdentifier; PhoneNumber { ; Label })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

PhoneNumber

The phone number.

"+49123456"

Label

Optional

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

Result Returns OK or error.

Description

This is a convenience function to add just one phone number with a given label to the contact.

Please call CNContactStore.UpdateContact later to store the values.

54.5 CNContact.AddPostalAddress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddPostalAddress"; ContactIdentifier { ; Label; Street; City; State; postalCode; country; ISOCountryCode; subLocality; subAdministrativeArea })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Label

Optional

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

Street

Optional

The street name with house number.

"Teststreet 123"

City

Optional

The city name.

"Greatcity"

State

Optional

The name of the state.

"TX"

postalCode

Optional

The postal code.

"12345"

country

Optional

The name of the country.

"USA"

ISOCountryCode

Optional

The ISO country code.

"US"

subLocality

54.5. *CNCONTACT.ADDPOSTALADDRESS*

1533

Optional

The sub locality. Only used on MacOS 10.12.4 or iOS 10.3 and newer.

subAdministrativeArea

Optional

The sub administrative area. Only used on MacOS 10.12.4 or iOS 10.3 and newer.

Result Returns OK or error.

Description

This is a convenience function to add just one postal address account with a given label to the contact. Please call `CNContactStore.UpdateContact` later to store the values.

54.6 CNContact.AddPostalAddressJSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddPostalAddressJSON"; ContactIdentifier; Label; JSON)

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Label

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

JSON

The block of JSON.

Result Returns OK or error.

Description

This is a convenience function to add just one postal address account with a given label to the contact. Please call CNContactStore.UpdateContact later to store the values.

The JSON should be an object with a few of the following keys: street, city, state, postalCode, country and ISOCountryCode. For MacOS 10.12.4 or iOS 10.3, you can set subLocality and subAdministrativeArea, too.

54.7 CNContact.AddRelation

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddRelation"; ContactIdentifier; Name; Label)

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Name

The name to use.

"Christian Schmitz"

Label

The label to use. For your convenience we translate Assistant, Brother, Child, Daughter, Father, Friend, Manager, Mother, Parent, Partner, Sister, Son and Spouse to the right values, so they get localized in display. Default label is Other.

"Dad"

Result Returns OK or error.

Description

This is a convenience function to add just one relation with a given label to the contact.

Please call CNContactStore.UpdateContact later to store the values.

54.8 CNContact.AddSocialProfile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddSocialProfile"; ContactIdentifier; Label; URLString; Username; UserIdentifier; Service)

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Label

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

URLString

The URL of the service.

"http://twitter.com/MBSPugins"

Username

The user name.

"MBSPugins"

UserIdentifier

The user identifier.

""

Service

The service name. For your convenience we accept here Facebook, Flickr, LinkedIn, MySpace, SinaWeibo, TencentWeibo, Twitter, Yelp and GameCenter to the correct constant.

"Twitter"

Result Returns OK or error.

Description

This is a convenience function to add just one social profile with a given label to the contact. Please call CNContactStore.UpdateContact later to store the values.

See also

54.9 CNContact.AddSocialProfileJSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddSocialProfileJSON"; ContactIdentifier; Label; JSON)

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Label

The label to use. For your convenience we translate Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

JSON

The JSON with the object containing the fields urlString, username, userIdentifier and service.

Result Returns OK or error.

Description

This is a convenience function to add just one social profile with a given label to the contact. Please call CNContactStore.UpdateContact later to store the values.

54.10 CNContact.AddURLAddress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.AddURLAddress"; ContactIdentifier; URL { ; Label })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

URL

The URL address.

"http://www.mbsplugins.com"

Label

Optional

The label to use. For your convenience we translate Homepage, Work, Home and Other to the right values, so they get localized in display. Default label is Other.

"Work"

Result Returns OK or error.

Description

This is a convenience function to add just one URL with a given label to the contact.

Please call CNContactStore.UpdateContact later to store the values.

54.11 CNContact.DeleteValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	10.1	Yes	No	No	No	Yes

MBS("CNContact.DeleteValue"; ContactIdentifier; Selector { ; Identifier })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Selector

Which value to set.

"givenName"

Identifier

Optional

Identifier or label to delete only one entry in a list. Pass empty text to delete all.

Result Returns OK or error.

Description

Selector can be birthday, contactRelations, dates, departmentName, emailAddresses, familyName, givenName, imageData, imageDataAvailable, instantMessageAddresses, jobTitle, middleName, namePrefix, nameSuffix, nickname, nonGregorianBirthday, organizationName, phoneNumbers, phoneticFamilyName, phoneticGivenName, phoneticMiddleName, phoneticOrganizationName, postalAddresses, previousFamilyName, socialProfiles, thumbnailImageData, note, type, ImageData and thumbnailImageData or urlAddresses.

PhoneNumbers, emailAddresses, postalAddresses, urlAddresses, contactRelations, socialProfiles, instantMessageAddresses and dates can specify a label/identifier to delete only one entry.

Examples

Delete home address:

```
MBS( "CNContact.DeleteValue"; $contactID; "postalAddresses"; "home")
```

Delete all emails:

```
MBS( "CNContact.DeleteValue"; $contactID; "emailAddresses"; "")
```

Delete job title:

```
MBS( "CNContact.DeleteValue"; $contactID; "jobTitle")
```

54.13 CNContact.IsUnifiedWithContact

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.5	Yes	No	No	No	Yes

MBS("CNContact.IsUnifiedWithContact"; ContactIdentifier; OtherContactIdentifier)

Parameters

ContactIdentifier

The contact identifier.

"9B6315CA-5331-44A6-96D0-16F315BA9AEB"

OtherContactIdentifier

The second contact identifier.

"F73B1D68-984A-434E-B3DE-1E92549C89B0:ABPerson"

Result Returns 1, 0 or error.

Description

Returns 1 if the receiver was fetched as a unified contact and includes the contact having contactIdentifier in its unification, else 0.

Examples

Check if a contact belongs to another:

```
MBS( "CNContact.IsUnifiedWithContact"; "9B6315CA-5331-44A6-96D0-16F315BA9AEB"; "F73B1D68-984A-434E-B3DE-1E92549C89B0:ABPerson" )
```

54.14 CNContact.JSON

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.JSON"; ContactIdentifier { ; SkipImage })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

SkipImage

Optional

Available in MBS FileMaker Plugin 8.5 or newer.

If you pass 1, we skip the images. Default is 0 to include images.

1

Result Returns JSON or error.

Description

If the application is not properly code signed with entitlements, you may only get limited data like no phone numbers.

Examples

Query your JSON:

```
MBS( "CNContact.JSON"; MBS( "CNContactStore.UnifiedMeContact" ) )
```

Get formatted and colored JSON:

```
Set Variable [ $json ; Value: MBS( "CNContact.JSON"; MBS( "CNContactStore.UnifiedMeContact" ) ) ]
```

```
Set Variable [ $json ; Value: MBS("JSON.Colorize"; MBS( "JSON.Format"; $json ) ) ]
```

```
Set Field [ Contacts::Result ; $json ]
```

54.17 CNContact.SetValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.SetValue"; ContactIdentifier; Selector; Value)

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Selector

Which value to set.

"givenName"

Value

The value to set.

"Test"

Result Returns OK or error.

Description

Selector can be birthday, contactRelations, dates, departmentName, emailAddresses, familyName, givenName, imageData, imageDataAvailable, instantMessageAddresses, jobTitle, middleName, namePrefix, nameSuffix, nickname, nonGregorianBirthday, organizationName, phoneNumbers, phoneticFamilyName, phoneticGivenName, phoneticMiddleName, phoneticOrganizationName, postalAddresses, previousFamilyName, socialProfiles, thumbnailImageData, note, type or urlAddresses.

ImageData and thumbnailImageData are passed as containers.

PhoneNumbers, emailAddresses, postalAddresses, urlAddresses, contactRelations, socialProfiles, instantMessageAddresses, dates, birthday and nonGregorianBirthday are passed as JSON.

Examples

Set given name fo ra contact:

```
Set Variable [ $r ; Value: MBS( "CNContact.SetValue"; $contactID; "givenName"; "Joe" ) ]
```

Clear email for contact:

```
// first set email list to empty JSON array:
```

```
MBS( "CNContact.SetValue"; "BD2307E5-92F6-4A8F-946D-C4804615C18B:ABPerson"; "emailAddresses";  
" [ ] )" &
```

```
// and save
```

```
MBS( "CNContactStore.UpdateContact"; "BD2307E5-92F6-4A8F-946D-C4804615C18B:ABPerson" )
```

Set email list with two emails:

```
// set email address list:
```

```
MBS( "CNContact.Value"; "BD2307E5-92F6-4A8F-946D-C4804615C18B:ABPerson"; "emailAddresses"; " [
```

54.17. CNCONTACT.SETVALUE

1549

```
{ \"label\" : \"_!<Home>!$_\", \"value\" : \"home@test.de\" }, { \"label\" : \"My Label\", \"value\" : \"private@test.de\" } ] ) &
// and save
MBS( \"CNContactStore.UpdateContact\"; \"BD2307E5-92F6-4A8F-946D-C4804615C18B:ABPerson\" )

Created 25th September 2018, last changed 26th September 2018.

54.21 CNContact.Value

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContact.Value"; ContactIdentifier; Selector { ; ImageType; FileName })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Selector

Which value to return.

"nickname"

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

FileName

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Result Returns value or error.

Description

Selector can be birthday, contactRelations, dates, departmentName, emailAddresses, familyName, givenName, imageData, imageDataAvailable, instantMessageAddresses, jobTitle, middleName, namePrefix, nameSuffix, nickname, nonGregorianBirthday, organizationName, phoneNumbers, phoneticFamilyName, phoneticGivenName, phoneticMiddleName, phoneticOrganizationName, postalAddresses, previousFamilyName, socialProfiles, thumbnailImageData, note, type or urlAddresses.

ImageData and thumbnailImageData are returned as container and you can pass in ImageType and FileName to use.

PhoneNumbers, emailAddresses, postalAddresses, urlAddresses, contactRelations, socialProfiles, instantMessageAddresses, dates, birthday and nonGregorianBirthday are returned as JSON.

Examples

Get my phone numbers:

MBS("CNContact.Value"; MBS("CNContactStore.UnifiedMeContact"); "phonenumbers")

Example result: [

```
{
  "identifier" : "7AA474C5-CB5B-406F-9C19-077E14E8F48B",
  "label" : "__$!<Mobile>!$_",
  "value" : "+49 1234 56789"
```

```

    },
    {
      "identifier" : "96F71635-B932-49C5-ABA6-905528A152D0",
      "label" : "_$!<Work>!$_",
      "value" : "+49 1234 56789"
    }
  ]

```

Get my social profiles:

```
MBS("CNContact.Value"; MBS("CNContactStore.UnifiedMeContact"); "socialprofiles")
```

Example result: [

```

{
  "identifier" : "DC992125-7999-4C52-ADF6-D544BC3ADA04",
  "label" : "Twitter",
  "value" : {
    "username" : "MBSPlugins",
    "userIdentifier" : null,
    "service" : "Twitter",
    "urlString" : "http://twitter.com/MBSPlugins"
  }
},
{
  "identifier" : "4D26EDF7-EE68-4125-AAF1-C79C5D4A66AA",
  "label" : "Facebook",
  "value" : {
    "username" : "MonkeybreadSoftware",
    "userIdentifier" : null,
    "service" : "Facebook",
    "urlString" : "http://facebook.com/MonkeybreadSoftware"
  }
}
]

```

Get image of contact as container value:

```
MBS( "CNContact.Value"; $contact; "imageData")
```

Query email addresses:

```
MBS( "CNContact.Value"; "BD2307E5-92F6-4A8F-946D-C4804615C18B:ABPerson"; "emailAddresses")
```

54.21.1 Blog Entries

- [MBS FileMaker Plugin, version 8.4pr4](#)

Created 1st August 2018, last changed 1st March 2020.

54.22 CNContactPicker.Close

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	10.1	Yes	No	No	No	Yes

MBS("CNContactPicker.Close")

Result Returns OK or error.

Description

See also

- 54.23 CNContactPicker.Current 1558
- 54.25 CNContactPicker.Show 1560

Created 31st January 2020, last changed 31st January 2020.

54.23 CNContactPicker.Current

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	10.1	Yes	No	No	No	Yes

MBS("CNContactPicker.Current")

Result Returns contact identifier or error.

Description

Can be called in trigger script to query current contact selected.
For multiple selection mode, this returns list of contacts.

See also

- 54.22 CNContactPicker.Close 1557

54.24 CNContactPicker.SetTrigger

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	10.1	Yes	No	No	No	Yes

MBS("CNContactPicker.SetTrigger"; FileName; ScriptName)

Parameters

FileName

The name of the FileMaker File that contains the script.

"test.fmp12"

ScriptName

The name of the script to run.

"MyScript"

Result Returns OK or error.

Description

This script is called when a contact is selected.

54.25 CNContactPicker.Show

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	10.1	Yes	No	No	No	Yes

MBS("CNContactPicker.Show" { ; Multi or Window; Position })

Parameters

Multi or Window

Optional

For iOS: Whether to allow multiple selection. Pass 1 for multiple or 0 for single selection. Default is single selection.

For MacOS: the window reference name/number.

0

Position

Optional

Where to position the popover. Can be "left" for left of the FileMaker window. Can be "right" for right side. Can be "mouse" to place where mouse is, e.g. when using with button. Can be "toolbar" to center on window hanging from toolbar.

"mouse"

Result Returns OK or error.

Description

Use CNContactPicker.Current later to get the result.

Examples

Show picker:

```
# use picker sheet/popover to select contact
Set Variable [ $r ; Value: MBS( "CNContactPicker.SetTrigger"; Get(FileName); "Picked" ) ]
Set Variable [ $r ; Value: MBS( "CNContactPicker.Show" ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to show picker" ; $r ]
End If
```

Show at mouse position in front window:

```
MBS( "CNContactPicker.Show"; 0; "mouse" )
```

54.26 CNContactStore.AddContact

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.AddContact"; ContactIdentifier { ; ContainerIdentifier })

Parameters

ContactIdentifier

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

ContainerIdentifier

Optional

The identifier for the container.

"9892A5CC-964E-497A-B877-A47619F7493C:ABAccount"

Result Returns OK or error.

Description

Optionally pass in container identifier to specify which account to use.

Examples

Create a contact:

```
#
Set Variable [ $contactID ; Value: MBS( "CNContactStore.NewContact" ) ]
Set Variable [ $r ; Value: MBS( "CNContact.SetValue"; $contactID; "givenName"; "Joe" ) ]

54.27 CNContactStore.AddGroup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.AddGroup"; Name { ; ContainerIdentifier })

Parameters

Name

The new group name.
"Test"

ContainerIdentifier

Optional
The identifier for the container.
"9892A5CC-964E-497A-B877-A47619F7493C:ABAccount"

Result Returns OK or error.

Description

Optionally pass in container identifier to specify which account to use.

Examples

Create a group:

```
Set Variable [ $r ; Value: MBS( "CNContactStore.AddGroup"; "Test Group" ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to create a group" ; $r ]
Else
Set Field [ Contacts::GroupID ; $r ]
End If

54.32 CNContactStore.Contacts

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.5	Yes	No	No	No	Yes

MBS("CNContactStore.Contacts" { ; unifyResults })

Parameters

unifyResults

Optional

Whether to unify results. 1 to unify contacts and 0 to return all individual contacts. Default is 1.

1

Result Returns list of contact identifiers or error.

Description

You get the list unified, so contacts in several accounts are merged.

Or you get list of all contacts with those merged which appear in multiple accounts.

Seems like Addressbook.people and CNContactStore.Contacts with unifyResults = 0 is the same list.

54.43 CNContactStore.DeleteContact

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.DeleteContact"; ContactIdentifier)

Parameters**ContactIdentifier**

The contact identifier.

"46B1E34D-58F9-4B6B-A80D-0F71ABB87A0E"

Result Returns OK or error.

Description**Examples**

Delete contact:

```

If [ Length ( Contacts::ContactID ) = 0 ]
Show Custom Dialog [ "Failed to delete a contact" ; "No ID in field" ]
Else
Set Variable [ $r ; Value: MBS( "CNContactStore.DeleteContact"; Contacts::ContactID ) ]
If [ MBS("IsError") ]

54.44 CNContactStore.DeleteGroup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.DeleteGroup"; GroupIdentifier)

Parameters

GroupIdentifier

The group identifier. Can be identifier or group name.

"F527BF7C-6426-4D48-86CA-CB5E57743FFE:ABGroup"

Result Returns OK or error.

Description

Examples

Delete group:

```

If [ Length ( Contacts::GroupID ) = 0 ]
Show Custom Dialog [ "Failed to delete a group" ; "No ID in field" ]
Else
Set Variable [ $r ; Value: MBS( "CNContactStore.DeleteGroup"; Contacts::GroupID ) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to delete a group" ; $r ]
Else
Set Field [ Contacts::GroupID ; "" ]
End If
End If

```

54.45 CNContactStore.GroupHierarchy

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.5	Yes	No	No	No	Yes

MBS("CNContactStore.GroupHierarchy")

Result Returns JSON or error.

Description

This is a convenience method to give you data for all groups with all subgroups and members in one call.

Examples

Query group hierarchie:

```
MBS("CNContactStore.GroupHierarchy")
```

```
Example result: {
  "62D07651-4F83-47D0-99F8-A72EAECBD8B7:ABGroup" : {
    "subgroups" : [
      "A0A7844B-1E8E-4ECF-8B81-273CB06B282D:ABGroup"
    ],
    "contacts" : [

54.46 CNContactStore.Groups

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.Groups")

Result Returns list or error.

Description

You get back a list with the group identifiers.

Examples

Show groups with IDs and names in field:

```

Set Variable [ $groups ; Value: MBS( "CNContactStore.Groups" ) ]
Set Variable [ $count ; Value: ValueCount ( $groups ) ]
If [ $count >0 ]
Set Variable [ $index ; Value: 1 ]
Set Variable [ $text ; Value: "" ]
Loop
#
Set Variable [ $groupID ; Value: GetValue($groups; $index) ]
Set Variable [ $groupName ; Value: MBS( "CNGroup.Name"; $groupID ) ]
Set Variable [ $text ; Value: $text & $GroupName & " " & $groupID ]
#
# next
Set Variable [ $index ; Value: $index + 1 ]
Exit Loop If [ $index >$count ]
Set Variable [ $text ; Value: $text & $ ]
End Loop
End If
Set Field [ Contacts::Result ; $text ]

```

54.47 CNContactStore.GroupsByName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	No

MBS("CNContactStore.GroupsByName"; Name)

Parameters

Name

The group name.
"Friends"

Result Returns list of group identifiers or error.

Description

Returns empty list if nothing found.
Comparison is localized case insensitive.

Examples

Query a group:

MBS("CNContactStore.GroupsByName"; "Zeitungen")

54.54 CNContactStore.RequestAccess

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.RequestAccess" { ; Wait })

Parameters

Wait

Optional

Available in MBS FileMaker Plugin 10.1 or newer.

Pass 1 to wait for user to decide or 0 to return immediately. Default is 0.

1

Result Returns OK or error.

Description

Users are able to grant or deny access to contact data on a per-application basis. To request access to contact data, call CNContactStore.RequestAccess function. This will not block the application while the user is being asked to grant or deny access. The user will only be prompted the first time access is requested; any subsequent ContactStore calls will use the existing permissions.

Later you can use CNContactStore.AuthorizationStatus to check status or CNContactStore.AuthorizationError to learn why you didn't get permissions.

The application needs to be code signed with entitlements with com.apple.security.personal-information.addressbook identifier. See also my idea here:

<https://community.filemaker.com/ideas/3240>

Examples

Request access:

```
Set Variable [ $r; Value: MBS( "CNContactStore.RequestAccess" ) ]
```

Request authorization with some error checking:

```
Set Variable [ $r ; Value: MBS( "CNContactStore.RequestAccess" ) ]
```

```
Pause/Resume Script [ Duration (seconds): 1 ]
```

```
Set Variable [ $r ; Value: MBS( "CNContactStore.AuthorizationError" ) ]
```

```
If [ Length($r) >0 ]
```

```
Show Custom Dialog [ "Error" ; $r ]
```

```
End If
```

```
Set Variable [ $groups ; Value: MBS( "CNContactStore.Groups" ) ]
```

```
If [ Length ( $groups ) = 0 ]
```

```
Show Custom Dialog [ "Possible Problem" ; "Either you have no groups or you did not code sign the app?"
```

```
]
```

```
End If
```

54.55 CNContactStore.SetChangeScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	Yes

MBS("CNContactStore.SetChangeScript"; Filename; ScriptName { ; Parameter })

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Parameter

Optional

The parameter to pass.

Result Returns OK or error.

Description

Examples

Set Trigger:

```
Set Variable [ $r ; Value: MBS( "CNContactStore.SetChangeScript"; Get(Filename); "Trigger" ) ]
```

Example Databases

54.57 CNContactStore.UnifiedMeContact

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
54 Contacts	8.4	Yes	No	No	No	No

MBS("CNContactStore.UnifiedMeContact")

Result Returns contact identifier or error.

Description

This will use unified contacts, so data is merged from several sources.

Examples

Get yourself as JSON:

```
MBS( "CNContact.JSON"; MBS( "CNContactStore.UnifiedMeContact" ) )
```

Get formatted and colored JSON:

```
Set Variable [ $json ; Value: MBS( "CNContact.JSON"; MBS( "CNContactStore.UnifiedMeContact" ) ) ]
```

```
Set Variable [ $json ; Value: MBS( "JSON.Colorize"; MBS( "JSON.Format"; $json ) ) ]
```

```
Set Field [ Contacts::Result ; $json ]
```

Chapter 55

Container

Functions to work on containers.

55.1 Container.Compress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	5.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.Compress"; ContainerValue)

Parameters

ContainerValue

The container value to compress.

Result Returns container value or error.

Description

Compression is not recommended for file formats which are normally compressed already. This includes PDF, various image formats like PNG and JPEG, video and audio files as well as zip archives. Compression works very well for text files.

It is recommended to check with `Container.GetTotalSize` to see if compressed data is smaller. If you compress an already compressed container, the result may be bigger due to the archive header.

Compressed containers can be detected by looking if the type list returned by `Container.GetTypes` contains an item named `ZLIB`. You can use `Container.GetTypeSize` to query the size of compressed data alone.

Not recommended for bigger file sizes. Compression may take long enough that user doesn't like to wait. e.g. 20 seconds for 300 MB.

Examples

Compress container:

```
Set Field [ Container Compression::Compressed; MBS("Container.Compress"; Container Compression::Some-Container) ]
```

55.2 Container.DecodeFromBase64

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	4.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.DecodeFromBase64"; type; text { ; filename; DontRenderPreview })

Parameters

type

The type to return. Can be JPEG, TIFF, GIF, PNG, PDF or File.

"JPEG"

text

The text to process.

filename

Optional

If filter is container, this defines the file name to use.

"test.txt"

DontRenderPreview

Optional

Pass 1 to not create a JPEG with preview of first page as part of the container. (only for returning PDF)

0

Result Returns container or error.

Description

See also Container.GetBase64.

If you have a DynaPDF Pro license and DynaPDF functions initialized, this function can add previews for the PDF file on Windows and Linux. For MacOS, we make them with PDFKit.

Examples

From PDF in Base64 to a PNG in Base64:

```
# decode some PDF in base64 text
Set Variable [ $PDFData; Value:MBS( "Container.DecodeFromBase64"; "PDF"; PDF_ToPNG::base64_PDF;
"test.pdf" ) ]
# render first page to a picture in PNG format
Set Variable [ $PNGData; Value:MBS( "PDFKit.GetPDFPageImage"; $PDFData; 0; "PNG"; "test.png";
150; 1; 0 ) ]
# encode PNG as Base64
Set Variable [ $EncodedPNG; Value:MBS( "Container.GetBase64"; $PNGData; "PNGf" ) ]
# store text in a field
Set Field [ PDF_ToPNG::Convert_text; $EncodedPNG ]
```

55.3 Container.DecodeFromHex

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	6.5	Yes	Yes	Yes	Yes	Yes

MBS("Container.DecodeFromHex"; type; text { ; filename; DontRenderPreview })

Parameters

type

The type to return. Can be JPEG, TIFF, GIF, PNG, PDF or File.

"JPEG"

text

The text to process.

filename

Optional

If filter is container, this defines the file name to use.

"test.txt"

DontRenderPreview

Optional

Pass 1 to not create a JPEG with preview of first page as part of the container. (only for returning PDF)

0

Result Returns container or error.

Description

If you have a DynaPDF Pro license and DynaPDF functions initialized, this function can add previews for the PDF file on Windows and Linux. For MacOS, we make them with PDFKit.

55.4 Container.Decompress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	5.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.Decompress"; ContainerValue)

Parameters

ContainerValue

The container value to decompress.

Result Returns container value or error.

Description

If you pass a compressed container value, this function will decompress it and return the container value with uncompressed data.

Compressed containers can be detected by looking if the type list returned by `Container.GetTypes` contains an item named ZLIB. You can use `Container.GetTypeSize` to query the size of compressed data alone.

Examples

Decompress container:

```
Set Field [ Container Compression::Decompressed; MBS("Container.Decompress"; Container Compression::Compressed) ]
```

55.5 Container.Deserialize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	5.2	Yes	Yes	Yes	Yes	Yes

MBS("Container.Deserialize"; Text)

Parameters

Text

The serialized data as text.

Result Returns container value or error.

Description

Examples

Serialize to a text field and deseralize back:

```
Set Field [ myTable::TextField ; MBS("Container.Serialize"; myTable::FirstContainerField) ]
Set Field [ myTable::OtherContainerField ; MBS("Container.Deserialize"; myTable::TextField) ]
```

55.6 Container.Export

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.6	Yes	Yes	Yes	Yes	Yes

MBS("Container.Export"; Container; Index or Type; FilePath)

Parameters

Container

The container where the data is stored.

Index or Type

Specify a type (like "JPEG", "PDF ", "GIF" or "PICT") or the index "JPEG"

FilePath

Absolute path to store file.

Result Returns "OK" on success or error message.

Description

For example you can write out from a TIFF image stored in the database the TIFF data itself or the preview JPEG.

Please note that types are always 4 characters long, "PDF " has a space on the end.

Some of the allowed types include "TIFF", "PDF ", "PNG", "GIF", "BMP", "EPS ", "PICT", "M4V", "WAV ", "M4A ", "MOV ", "AVI ", "AU ", "MP3 ", "MPEG", "MPG4", "AIFF", "8BPS", "FILE", "MAIN", "JPEG" and maybe some more.

To convert image formats, please review GraphicsMagick functions like `GImage.NewFromContainer` and `GImage.WriteToPNGContainer`.

To convert PDF to PNG, check functions like `PDFKit.GetPDFPageImage`, `DynaPDF.GeneratePreview` or `DynaPDF.RenderPage`.

This function is only for internal containers. Please use `Container.WriteFile` for all containers.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Export JPEG file:

```
MBS("Container.Export"; Files::data; "JPEG"; GetAsText(Files::data)+".jpg")
```

Export all streams in container to individual files:

```
Set Variable [ $container; Value:Test::Image ]
```

```

# where to save
Set Variable [ $DesktopFolder; Value:MBS("Folders.UserDesktop") ]
# loop over streams in container
Set Variable [ $count; Value:MBS( "Container.GetCount"; $container ) ]
Set Variable [ $index; Value:0 ]
Loop
# query the type of stream with given index
Set Variable [ $type; Value:MBS( "Container.GetType"; $container; $index ) ]
# write it to a file
Set Variable [ $path; Value:$DesktopFolder & "/" & $type ]
Set Variable [ $r; Value:MBS( "Container.Export"; $container; $index; $path ) ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $count = $index ]
End Loop

```

Export a container to desktop:

```

# get path stored in the container field
Set Variable [ $ContainerPath ; Value: GetAsText ( Contacts::Photo Container ) ]
# get the file name portion
Set Variable [ $ContainerName ; Value: MBS( "Path.LastPathComponent"; $ContainerPath ) ]
# take a folder on the computer, e.g. desktop
Set Variable [ $DesktopFolder ; Value: MBS( "Folders.UserDesktop" ) ]
# build path with file name on that folder
Set Variable [ $FilePath ; Value: MBS( "Path.AddPathComponent"; $DesktopFolder; $ContainerName ) ]
# and export the content of container to that path
Set Variable [ $r ; Value: MBS( "Container.WriteFile"; Contacts::Photo Container; $FilePath ) ]

```

55.7 Container.ExtractStream

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	4.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.ExtractStream"; Container; InputType { ; NewName; OutputType })

Parameters

Container

The container value to modify.

\$data

InputType

The input type.

"JPEG"

NewName

Optional

The new file name to use.

"test.psd"

OutputType

Optional

The output type.

"FILE"

Result Returns modified container value.

Description

See Container.GetTypes to figure out what stream types a container value has.

Examples

Extract a Photoshop image and package it like a file import:

```
MBS("Container.ExtractStream"; Test::InputContainer; "8BPS"; "test.psd"; "FILE")
```

See also

55.8 Container.GetBase64

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetBase64"; Container; Name or Index)

Parameters

Container

The container field or value to inspect.

MyTable::MyContainerField

Name or Index

either the name of the Type or it's index

0

Result Returns data or error.

Description

You must tell the plug-in which of the types in the container field you want to use. You can use either it's name (JPEG, TIFF, PNGf etc) or it's index. The index is from 0 to the count of types -1 You can use Container.GetCount to return the count of types in the container.

You can pass index zero and get data form references file in case container is a file reference.

See also Container.DecodeFromBase64.

Examples

Get PNG image in Container as Base64:

```
MBS( "Container.GetBase64"; MyTable::MyContainerField; "PNGf" )
```

Get JPEG image in Container as Base64:

```
MBS( "Container.GetBase64"; MyTable::MyContainerField; "JPEG" )
```

From PDF in Base64 to a PNG in Base64:

```
# decode some PDF in base64 text
Set Variable [ $PDFData; Value:MBS( "Container.DecodeFromBase64"; "PDF"; PDF_ToPNG::base64_PDF;
"test.pdf" ) ]
# render first page to a picture in PNG format
Set Variable [ $PNGData; Value:MBS( "PDFKit.GetPDFPageImage"; $PDFData; 0; "PNG"; "test.png";
150; 1; 0 ) ]
# encode PNG as Base64
Set Variable [ $EncodedPNG; Value:MBS( "Container.GetBase64"; $PNGData; "PNGf" ) ]
# store text in a field
Set Field [ PDF_ToPNG::Convert_text; $EncodedPNG ]
```

55.9 Container.GetCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetCount"; Container)

Parameters

Container

The container field or variable containing container value.

Description

A container contains several data parts, each with an unique type. This returns the number of types in a container.

Examples

Export all streams in container to individual files:

```
Set Variable [ $container; Value:Test::Image ]
# where to save
Set Variable [ $DesktopFolder; Value:MBS("Folders.UserDesktop") ]
# loop over streams in container
Set Variable [ $count; Value:MBS( "Container.GetCount"; $container ) ]
Set Variable [ $index; Value:0 ]
Loop
# query the type of stream with given index
Set Variable [ $type; Value:MBS( "Container.GetType"; $container; $index ) ]
# write it to a file
Set Variable [ $path; Value:$DesktopFolder & "/" & $type ]
Set Variable [ $r; Value:MBS( "Container.Export"; $container; $index; $path ) ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $count = $index ]
End Loop
```

55.10 Container.GetDataURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetDataURL"; container)

Parameters

container

The container field or value to inspect.

Result Returns Container or error.

Description

This is very useful for displaying images in web pages. The function tries to make data urls from the images in the container field in the following order: Tiff, PNG, PDF, GIF, JPEG Unfortunately, FileMaker on Windows XP doesn't display image urls very well since it is based on Internet Explorer which doesn't like Image URLs.

In plugin version this also works for referenced JPEG images.

Example Databases

55.11 Container.GetHeight

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetHeight"; Container)

Parameters

Container

The container field or value to inspect.

Description

This is based on the metadata in the container (SIZE part) stored by FileMaker and not based on the actual content of the container.

Examples

Get the Height

MBS("Container.GetWidth" ; ContainerField)

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	6.5	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetHex"; Container; Name or Index)

Parameters

Container

The container field or value to inspect.

MyTable::MyContainerField

Name or Index

either the name of the Type or it's index

0

Result Returns data or error.

Description

You must tell the plug-in which of the types in the container field you want to use. You can use either it's name (JPEG, TIFF, PNGf etc) or it's index. The index is from 0 to the count of types -1 You can use Container.GetCount to return the count of types in the container.

55.13 Container.GetJPEGHeight

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetJPEGHeight"; Container)

This function was ?? removed for MBS FileMaker Plugin 9.0. Please move to newer functions or keep using older plugins.

Parameters

Container

The container field or value to inspect.

Description

The height is in pixels. FileMaker always stores a copy of every image as a JPEG (unless it is already a JPEG). This function is targeting that JPEG.

Examples

Get the height of the JPEG image

MBS("Container.GetJPEGHeight" ; ContainerField)

55.18 Container.GetResolution

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	4.2	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetResolution"; Container { ; Selector })

Parameters

Container

The container field or value to inspect.

MyTable::MyContainerField

Selector

Optional

Optional, if you pass "x" or "y" only the requested value is returned.

"x"

Result Returns value or error.

Description

This does not look into the image resolution of an image, but just in the metadata FileMaker stored there when importing the image. FileMaker stores resolution in "DPI " part in the container.

If selector x or y are passed, we return just the DPI value in x or y direction. If no selector is passed, we return list with both values. First entry is x, second y.

Examples

Query resolution:

MBS("Container.GetResolution"; MyTable::MyContainerField)

Example result: "300

300"

Query X resolution:

MBS("Container.GetResolution"; MyTable::MyContainerField; "x")

Example result: 300

Query Y resolution:

MBS("Container.GetResolution"; MyTable::MyContainerField; "y")

Example result: 300

55.19 Container.GetSize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetSize"; Container; Type)

Parameters

Container

The container field or value to inspect.

Type

Name or index

Description

A container contains several data parts with data and this function queries size in bytes of one of them. You must pass either the name of the type you wish to get or its index. Index start at 0.

See Container.GetTotalSize to query size of all data in a container.

Examples

Query size of container with PNG:

```
MBS("Container.GetSize"; Images::Image; "PNGf")
```

55.20 Container.GetText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	7.2	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetText"; Container; Name or Index { ; Encoding })

Parameters

Container

The container field or value to inspect.

MyTable::MyContainerField

Name or Index

either the name of the Type or it's index

0

Encoding

Optional

The text encoding for result. Default is native.

UTF8

Result Returns text or error.

Description

You must tell the plug-in which of the types in the container field you want to use. You can use either it's name (JPEG, TIFF, PNGf etc) or it's index. The index is from 0 to the count of types -1 You can use Container.GetCount to return the count of types in the container.

You can pass index zero and get data form references file in case container is a file reference.

Examples

Show main item in container:

```
Show Custom Dialog [ "Main item"; MBS("Container.GetText"; test::Test; "MAIN") ]
```

Query text of XML file in a container:

```
Set Variable [ $text ; Value: MBS( "Container.GetText"; test::test; "FILE"; "UTF-8") ]
```

Parameters

Container

The container field or value to inspect.

Description

A file is typically broken up into several object types when stored in a container field. This function returns the total size of all those objects.

Examples

Get Total Size

MBS("Container.GetTotalSize" ; ContainerField)

Created 18th August 2014, last changed 20th May 2019.

55.22 Container.GetType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetType"; Container; index)

Parameters

Container

The container field or value to inspect.

\$container

index

The index of the the item to query in the container.

0

Description

A container contains several data parts, each with an unique type. Types are 4 character long and some types like "PDF " have an extra space.

See Container.GetTypes to query list of all types in a container.

Examples

Export all streams in container to individual files:

```
Set Variable [ $container; Value:Test::Image ]
# where to save
Set Variable [ $DesktopFolder; Value:MBS("Folders.UserDesktop") ]
# loop over streams in container
Set Variable [ $count; Value:MBS( "Container.GetCount"; $container ) ]
Set Variable [ $index; Value:0 ]
Loop
# query the type of stream with given index
Set Variable [ $type; Value:MBS( "Container.GetType"; $container; $index ) ]
# write it to a file
Set Variable [ $path; Value:$DesktopFolder & "/" & $type ]
Set Variable [ $r; Value:MBS( "Container.Export"; $container; $index; $path ) ]
# next
Set Variable [ $index; Value:$index + 1 ]
Exit Loop If [ $count = $index ]
End Loop
```

55.23 Container.GetTypeSize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetTypeSize"; Container; Type)

Parameters

Container

The container field or value to inspect.

\$container

Type

The type code for the type to check. e.g. "JPEG" for a jpeg image.

"JPEG"

Description

For referenced files, this function will just return the size of the referenced file independent of the type.

See Container.GetTotalSize to query size of all data in a container.

Examples

Get size of PNG image

```
MBS( "Container.GetTypeSize" ; ContainerField; "PNGf" )
```

Get the size of a JPEG image

```
MBS( "Container.GetTypeSize" ; ContainerField; "JPEG" )
```

Get the size of a TIFF image

```
MBS( "Container.GetTypeSize" ; ContainerField; "TIFF" )
```

55.24 Container.GetTypes

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetTypes"; Container)

Parameters

Container

The container field or value to inspect.

Result Returns types or error.

Description

FileMaker stores a copy of the image in the container field as a JPEG if the image is not already of that type. That is why you will always see JPEG in the list of Types, even if the image in question is a PNG. This function will have "FILE" in the list of types if the image has File inserted into it.

Some of the allowed types include "TIFF", "PDF ", "PNGf", "GIFf", "BMPf", "EPS ", "PICT", "FILE" and "JPEG".

"ZLIB" is the type used by compressed containers.

This function does not work for unencrypted external containers.

Examples

Get Types

MBS("Container.GetTypes" ; ContainerField)

55.25 Container.GetWidth

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	1.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.GetWidth"; Container)

Parameters

Container

The container field or value to inspect.

Description

This is based on the metadata in the container (SIZE part) stored by FileMaker and not based on the actual content of the container.

Examples

Get the width

MBS("Container.GetWidth" ; ContainerField)

See also

55.26 Container.IsCompressed

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	7.5	Yes	Yes	Yes	Yes	Yes

MBS("Container.IsCompressed"; Container)

Parameters

Container

The container field or value to inspect.

Result Returns 1, 0 or error.

Description

Returns 1 if compressed and 0 if not.

55.27 Container.ReadArchive

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	4.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.ReadArchive"; Path)

Parameters

Path

Native path to the archive file to use.

"C:\Benutzer\Christian\Desktop\test.txt"

Result Returns OK or error.

Description

Please use Container.WriteArchive to create the archive. The zip file must have a special format to be read successful, so probably only archives created by Container.WriteArchive will work.

This works for any content of a container, except for referenced container files.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Reads an archive:

```
MBS("Container.ReadArchive"; "C:\Benutzer\Christian\Desktop\test.txt")
```

Writes an archive:

```
MBS("Container.WriteArchive"; MyTable::MyContainer; "C:\Benutzer\Christian\Desktop\test.txt")
```

See also

- 55.28 Container.ReadFile 1645
- 55.34 Container.WriteArchive 1656
- 121.2 Path.FileMakerPathToNativePath 6139

Example Databases

- [Containers/Archive Container](#)

Created 21st September 2014, last changed 21st September 2014.

55.28 Container.ReadFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	6.4	Yes	Yes	Yes	Yes	Yes

```
MBS( "Container.ReadFile"; FilePath { ; mode; filename } )
```

Parameters

FilePath

The native file path. Something like `"/Users/cs/desktop/test.txt"` on Mac and `"C:\Programs\Data\test.txt"` on Windows. Files without path end in the root directory on Mac.

`"test.txt"`

mode

Optional

If missing or `"auto"`, the plugin will try to detect type by file name extension. If filter is `"container"`, the result is returned as a container with a FILE stream inside. The type can be specific here like PDF, JPEG, TIFF, GIF, BMP or PSD to return as image container. Or `"compressed"` to return a compressed container.

`"Auto"`

filename

Optional

If result is container, this defines the file name to use.

`"test.txt"`

Result Returns container value or error.

Description

Reads the data in the file and returns as container.

See also `Text.ReadTextFile` for reading text files with specific encoding.

For reading simple text files, please use `Text.ReadTextFile`.

See also `Files.ReadFile`, `Files.ReadJPEG`, `Files.ReadPDF`, `Files.ReadPNG`, `Text.ReadTextFile` and `RichText.ReadFile`.

This function is optimized for FM 14 and newer to stream file content when using auto mode. This allows to import up to 4 GB of data in small chunks.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Read image file:

```
MBS( "Container.ReadFile"; "/Users/cs/Pictures/test.jpg"; "auto")
```

Read image file with error checking:

```
# get native path
Set Variable [ $path ; Value: "/Users/cs/Pictures/mond.jpg" ]
#
# read file
Set Variable [ $content ; Value: MBS( "Container.ReadFile"; $path) ]
#
# check for error
If [ MBS("IsError") = 0 ]
Set Field [ Contacts::Photo Container ; $content ]
Else
Show Custom Dialog [ "Failed to read file." ; $content ]
End If
```

55.29 Container.ReadImage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	8.4	Yes	No	Yes, macOS only	No	No

MBS("Container.ReadImage"; Container { ; ImageType; Filename })

Parameters

Container

The container field or value to inspect.

MyTable::MyContainerField

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Result Returns image container or error.

Description

This function is useful to read all the image formats supported by Apple's frameworks and convert them to a common format like JPEG or PNG.

Use this function to convert old PICT images in containers.

Works as well for HEIC and HEIF images.

Examples

Convert PICT to PNG:

```
Set Field [ Test::output ; MBS("Container.ReadImage"; Test::OldImage; "PNG"; "image.png") ]
```

Read file from disk and read as image:

```
Set Field [ Batch Emailer::Inline Graphics ; MBS("Container.ReadImage"; MBS("Container.ReadFile";  
"/Users/cs/Desktop/test.heic")) ]
```

Read HEIC file:

```
Set Variable [ $path ; Value: "/Users/cs/Desktop/IMG_3552.HEIC" ]
Set Variable [ $container ; Value: MBS( "Container.ReadFile"; $path) ]
If [ MBS("IsError") = 0 ]
Set Variable [ $image ; Value: MBS( "Container.ReadImage"; $container; "PNG"; "image.png") ]
If [ MBS("IsError") = 0 ]
Set Field [ Untitled::image ; $image ]
End If
```

55.29. *CONTAINER.READIMAGE*

1649

End If

55.30 Container.Remove

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	3.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.Remove"; Container; Type)

Parameters

Container

The container field or value to inspect.

Type

The type code of the stream to remove. Can be "PDF ", "JPEG" or one of the other usual types. "JPEG"

Result Returns modified container value or error.

Description

This function can be used to remove the JPEG preview from an image.

Or if you have a container with PDF and preview, you could remove the PDF to just get the preview image.

Use Container.GetTypes to learn what types are inside a container.

Examples

Renames an image to have a new file extension.

```
$jpegOnly = MBS( "Container.Remove"; $PDFContainer; "JPEG" )
```

Remove PDF from container value:

```
/* PDF produced with DynaPDF Pro will have Preview image. Removing PDF will reveal the preview: */
MBS( "Container.Remove"; FinalPDF; "PDF " )
```

55.30. *CONTAINER.REMOVE*

1651

Created 18th August 2014, last changed 20th May 2019.

55.31 Container.Rename

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	3.0	Yes	Yes	Yes	Yes	Yes

MBS("Container.Rename"; Container; name)

Parameters

Container

The container field or value to inspect.

name

New file name or new path list.

"test.jpg"

Result Returns modified container value or error.

Description

Does only work for normal containers, not with referenced files.

Examples

Renames an image to have a new file extension.

```
$oldname = MBS( "Container.GetName"; $container )
$newname = substitute($oldname; ".jpg"; ".png")
$newcontainer = MBS( "Container.Rename"; $container; $newname )
```

Rename external saved container:

```
# rename field container into variable
Set Variable [ $newContainer; Value:MBS( "Container.Rename"; test::file; "test.txt" ) ]
# Put new container in field
Set Field [ test::file; $newContainer ]
# write changes to disk
Commit Records/Requests [ ]
```

55.32 Container.RenameStream

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	4.3	Yes	Yes	Yes	Yes	Yes

MBS("Container.RenameStream"; Container; InputType; OutputType)

Parameters

Container

The container field or value to inspect.

\$data

InputType

The input type.

"JPEG"

OutputType

The output type.

"FILE"

Result Returns modified container value.

Description

See Container.GetTypes to figure out what stream types a container value has.

Examples

Rename JPEG like a file import:

```
MBS("Container.RenameStream"; Test::InputContainer; "JPEG"; "FILE")
```

See also

55.33 Container.Serialize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	5.2	Yes	Yes	Yes	Yes	Yes

MBS("Container.Serialize"; Container)

Parameters

Container

The container field or value to serialize.

Result Returns text or error.

Description

The container content is stored in a base64 encoded string which the plugin function Container.Deserialize can read.

Does not work with external containers.

Using this function allows to store a container in a text field or transmit it with Socket functions, SerialPort functions or by writing it to a file.

Examples

Serialize to a text field and deseralize back:

```
Set Field [ myTable::TextField ; MBS("Container.Serialize"; myTable::FirstContainerField) ]
```

```
Set Field [ myTable::OtherContainerField ; MBS("Container.Deserialize"; myTable::TextField) ]
```

55.34 Container.WriteArchive

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	4.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.WriteArchive"; Container; Path)

Parameters

Container

The container field or value to archive.

MyTable::MyContainer

Path

Native path to the archive file to use.

"C:\Benutzer\Christian\Desktop\test.txt"

Result Returns OK or error.

Description

This function allows you to archive whatever the container contains into a zip archive. Please use Container.ReadArchive to read back.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Reads an archive:

```
MBS("Container.ReadArchive"; "C:\Benutzer\Christian\Desktop\test.txt")
```

Writes an archive:

```
MBS("Container.WriteArchive"; MyTable::MyContainer; "C:\Benutzer\Christian\Desktop\test.txt")
```

55.35 Container.WriteFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
55 Container	6.4	Yes	Yes	Yes	Yes	Yes

MBS("Container.WriteFile"; Data; FilePath)

Parameters

Data

The container field or value to save.

\$Image

FilePath

The native file path. Something like `"/Users/cs/desktop/test.jpg"` on Mac and `"C:\Programs\Data\test.jpg"` on Windows. Files without path end in the root directory on Mac.

`"test.jpg"`

Result Returns OK or error.

Description

See also `Files.WriteFile` for more options.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Read a file and write it elsewhere

```
Set Variable [ $Image; Value:MBS( "Container.ReadFile"; "/Users/cs/Pictures/Test.jpg" ) ]
Set Variable [ $r; Value:MBS( "Container.WriteFile"; $Image; "/Users/cs/Desktop/target.jpg" ) ]
```

Export a container to desktop:

```
# get path stored in the container field
Set Variable [ $ContainerPath ; Value: GetAsText ( Contacts::Photo Container ) ]
# get the file name portion
Set Variable [ $ContainerName ; Value: MBS( "Path.LastPathComponent"; $ContainerPath ) ]
# take a folder on the computer, e.g. desktop
Set Variable [ $DesktopFolder ; Value: MBS( "Folders.UserDesktop" ) ]
# build path with file name on that folder
Set Variable [ $FilePath ; Value: MBS( "Path.AddPathComponent"; $DesktopFolder; $ContainerName ) ]
# and export the content of container to that path
Set Variable [ $r ; Value: MBS( "Container.WriteFile"; Contacts::Photo Container; $FilePath ) ]
```

Write a HTML file and an image file to load in web viewer:

```
Set Variable [ $folder ; Value: MBS( "Folders.UserTemporary" ) ]
```

```

Set Variable [ $path ; Value: MBS( "Path.AddPathComponent"; $folder; "test.jpg" ) ]
Set Variable [ $r ; Value: MBS( "Container.WriteFile"; Images::Image; $path ) ]
#
Set Variable [ $html ; Value: "<html><body><p>Hello World</p><img src=test.jpg width=300></body></html>" ]
Set Variable [ $path ; Value: MBS( "Path.AddPathComponent"; $folder; "test.html" ) ]
Set Variable [ $r ; Value: MBS( "Text.WriteTextFile"; $html; $path ) ]
#
Set Variable [ $URL ; Value: MBS( "Path.FilePathToFileURL"; $Path ) ]
Set Web Viewer [ Object Name: "web" ; URL: $URL ]

```

ContinuityCamera

A panel for iOS to select or take picture.

You can take a new picture via camera, record video or pick an existing picture.

56.1 ContinuityCamera.Clear

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
92 ImagePicker 56 ContinuityCamera	9.2	Yes	No	No	No	No

MBS("ContinuityCamera.Clear")

Result Returns OK or error.

Description

See also

- 92.2 ContinuityCamera.Import 5034
- 92.4 ContinuityCamera.Result 5037

Created 3th April 2019, last changed 6th January 2020.

56.2 ContinuityCamera.Import

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
92 ImagePicker 56 ContinuityCamera	9.2	Yes	No	No	No	No

MBS("ContinuityCamera.Import"; Type)

Parameters

Type

Pass 0 for Photo (default) or 1 for document.

0

Result Returns OK or error.

Description

Examples

Import photo:

```
Set Variable [ $r ; Value: MBS("ContinuityCamera.Import";0) ]
```

Import document:

```
Set Variable [ $r ; Value: MBS("ContinuityCamera.Import"; 1) ]
```

56.3 ContinuityCamera.PopupMenu

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
92 ImagePicker 56 ContinuityCamera	9.2	Yes	No	No	No	No

MBS("ContinuityCamera.PopupMenu"; mode { ; x; y; window; item; objectName })

Parameters

mode

The mode to use. Can be "mouse", "screen" or "window". Default is mouse for leaving away the parameter or passing empty text. Version 8.3 adds mode "content" to make it relative to the content part of the window, below toolbars.

"mouse"

x

Optional

The relative x coordinates for the position relative to the mouse, screen or window.

0

y

Optional

The relative y coordinates for the position relative to the mouse, screen or window.

0

window

Optional

The window reference for the showing menu relative to a window.

\$window

item

Optional

The menu item to be positioned at the specified location in the view.

\$item

objectName

Optional

The object name for mode=object.

"web"

Result Returns 1, 0 or error.

Description

Returns 1 if item was selected or 0 if not.

56.4 ContinuityCamera.Result

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
92 ImagePicker 56 ContinuityCamera	9.2	Yes	No	No	No	No

MBS("ContinuityCamera.Result" { ; FileName })

Parameters

FileName

Optional

File name to use.

"test.jpg"

Result Returns container value or error.

Description

The result may be PNG, PDF, JPEG or TIFF document.

Usually documents come as PDF and images as JPEG.

Examples

Write result to container field:

Set Field [ContinuityCamera::Image ; MBS("ContinuityCamera.Result")]

56.5 ContinuityCamera.SetScriptTrigger

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
92 ImagePicker 56 ContinuityCamera	9.2	Yes	No	No	No	No

MBS("ContinuityCamera.SetScriptTrigger"; Filename; ScriptName)

Parameters

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

When some picture or document is available, we call the script.

Parameter to the script is currently the document type, e.g. JPEG, TIFF or PDF.

Examples

Set trigger:

```
Set Variable [ $r ; Value: MBS("ContinuityCamera.SetScriptTrigger"; Get(Filename); "ContinuityCamera-Trigger") ]
```

Chapter 57

CoreImage

Core Image Process on Mac

57.1 CoreImage.Detect

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
57 CoreImage	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreImage.Detect"; Image; Type { ; Options })

Parameters

Image

The image to check. Pass container here with image.

Type

The type of recognizer to use. Can be Face, Rectangle, Text or QRCode.

"Face"

Options

Optional

List of options. If EyeBlink is included, facial expressions, such as blinking and closed eyes are extracted. If Smile is included, facial expressions, such as smile are extracted.

"EyeBlink\$Smile"

Result Returns JSON or error.

Description

This function can do face recognition, find text or rectangle areas and read barcodes.

Result is a JSON structure with all the results.

See also [Vision.RecognizeText](#), [Vision.DetectBarcode](#) and [Vision.ClassifyImage](#).

Type	macOS Versions	iOS Versions	Description
Face	macOS 10.7 or newer	iOS 5.0 and newer	Detects faces and eyes
Rectangle	macOS 10.10 or newer	iOS 8.0 and newer	Detects rectangles
QRCode	macOS 10.10 or newer	iOS 8.0 and newer	Detects barcodes
Text	macOS 10.11 or newer, 64-bit only	iOS 9.0 and newer	Detects text areas

Chapter 58

CoreLocation

Query location of a Mac..

58.1 CoreLocation.ClearFailHandler

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.ClearFailHandler")

Result Returns OK or error.

Description

See also

- 58.6 CoreLocation.SetFailHandler 1674

Example Databases

- [Mac and iOS/CoreLocation/CoreLocation](#)

Created 18th August 2014, last changed 18th August 2014.

58.2 CoreLocation.ClearUpdateLocationHandler

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.ClearUpdateLocationHandler")

Result Returns OK or error.

Description

See also

- 58.7 CoreLocation.SetUpdateLocationEvaluate 1675
- 58.8 CoreLocation.SetUpdateLocationHandler 1676

Example Databases

- [Mac and iOS/CoreLocation/CoreLocation](#)

Created 18th August 2014, last changed 18th August 2014.

58.3 CoreLocation.RegionMonitoringAvailable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	Yes	No	No	No	Yes

MBS("CoreLocation.RegionMonitoringAvailable")

Result Returns 1, 0 or error.

Description

Support for region monitoring may not be available on all devices and models. You should check the value of this property before attempting to set up any regions or initiate region monitoring.

Even if region monitoring support is present on a device, it may still be unavailable because the user disabled it for the current app or for all apps.

See also

- 58.4 CoreLocation.RegionMonitoringEnabled

1672

Created 17th February 2019, last changed 17th February 2019.

58.4 CoreLocation.RegionMonitoringEnabled

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	Yes	No	No	No	Yes

MBS("CoreLocation.RegionMonitoringEnabled")

Result Returns 1, 0 or error.

Description

In iOS, the user can enable or disable location services (including region monitoring) using the controls in Settings >Location Services.

You should check the return value of this method before starting region monitoring updates to determine whether the user currently allows location services to be used at all. If this method returns false and you start region monitoring updates anyway, the Core Location framework prompts the user to confirm asking whether location services should be reenabled.

This method does not check to see if region monitoring capabilities are actually supported by the device. Therefore, you should also check the return value of the regionMonitoringAvailable() class method before attempting to start region monitoring services.

See also

- 58.3 CoreLocation.RegionMonitoringAvailable

1671

Created 17th February 2019, last changed 17th February 2019.

58.5 CoreLocation.SetFailEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	6.2	Yes	No	No	No	Yes

MBS("CoreLocation.SetFailEvaluate"; Expression)

Parameters

Expression

The expression to evaluate. Can be in local language of FileMaker Pro or english. For Server must always be in english.

"Let (\$\$Done = 1 ; 1)"

Result Returns OK or error.

Description

See also

- 58.6 CoreLocation.SetFailHandler

1674

58.5.1 Blog Entries

- [MBS FileMaker Plugin, version 6.2pr2](#)

Created 29th March 2016, last changed 4th April 2018.

58.6 CoreLocation.SetFailHandler

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	No	No	Yes

MBS("CoreLocation.SetFailHandler"; FileName; ScriptName)

Parameters

FileName

The name of the FileMaker file that contains the script
Get(FileName)

ScriptName

The name of the script to run

Result Returns OK or error.

Description

Scriptparameter is a localized error message.

With plugin version 6.0 or newer the script name can be a script ID number. In that case the plugin queries the script name for the given script ID. This allows to call scripts by ID and avoid problems if scripts are later renamed.

Examples

Registers drag action handler:

```
MBS( "CoreLocation.SetFailHandler"; Get ( FileName ); "CoreLocationError"
```

See also

- 58.1 CoreLocation.ClearFailHandler 1669
- 58.5 CoreLocation.SetFailEvaluate 1673

Example Databases

- [Mac and iOS/CoreLocation/CoreLocation](#)

Created 18th August 2014, last changed 9th November 2018.

58.7 CoreLocation.SetUpdateLocationEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	6.2	Yes	No	No	No	Yes

MBS("CoreLocation.SetUpdateLocationEvaluate"; Expression)

Parameters

Expression

The expression to evaluate. Can be in local language of FileMaker Pro or english. For Server must always be in english.

"Let (\$\$Done = 1 ; 1)"

Result Returns OK or error.

Description

You can query current location with the other location functions.

You don't need to install this evaluation to read location. You can always simply call location functions to get last known location.

See also

- 58.2 CoreLocation.ClearUpdateLocationHandler 1670

58.7.1 Blog Entries

- [MBS FileMaker Plugin, version 6.2pr2](#)

Created 29th March 2016, last changed 4th April 2018.

58.8 CoreLocation.SetUpdateLocationHandler

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	No	No	Yes

MBS("CoreLocation.SetUpdateLocationHandler"; FileName; ScriptName)

Parameters

FileName

The name of the FileMaker File that contains the script
"test.fp7"

ScriptName

The name of the script to run
"MyScript"

Result Returns OK or error.

Description

You can query current location with the other location functions.

You don't need to install this script call to read location. You can always simply call location functions to get last known location.

With plugin version 6.0 or newer the script name can be a script ID number. In that case the plugin queries the script name for the given script ID. This allows to call scripts by ID and avoid problems if scripts are later renamed.

Examples

Registers drag action handler:

```
MBS( "CoreLocation.SetUpdateLocationHandler"; Get ( FileName ); "CoreLocationUpdate"
```

58.9 CoreLocation.altitude

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.altitude")

Result Returns altitude as number.

Description

Positive values indicate altitudes above sea level. Negative values indicate altitudes below sea level. This function queries current know location. It's updated from time to time. To receive a script call when new location is available, please use CoreLocation.SetUpdateLocationHandler.

Returns zero if not location is available. See CoreLocation.hasLocation function.

See also

- 58.17 CoreLocation.hasLocation 1686
- 58.20 CoreLocation.latitude 1689
- 58.22 CoreLocation.longitude 1691

Created 18th August 2014, last changed 12nd September 2019.

58.10 CoreLocation.authorizationStatus

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	Yes	No	No	No	Yes

MBS("CoreLocation.authorizationStatus")

Result Returns status or error.

Description

The authorization status of a given app is managed by the system and determined by several factors. Apps must be explicitly authorized to use location services by the user and location services must themselves currently be enabled for the system. A request for user authorization is displayed automatically when your app first attempts to use location services.

notDetermined	The user has not yet made a choice regarding whether this app can use location services.
restricted	This app is not authorized to use location services.
denied	The user explicitly denied the use of location services for this app or location services are currently disabled in Settings.
authorizedAlways	This app is authorized to start location services at any time.
authorizedWhenInUse	This app is authorized to start most location services while running in the foreground.

Created 17th February 2019, last changed 17th February 2019.

58.11 CoreLocation.course

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.course")

Result Returns direction number.

Description

Course values are measured in degrees starting at due north and continuing clockwise around the compass. Thus, north is 0 degrees, east is 90 degrees, south is 180 degrees, and so on. Course values may not be available on all devices. A negative value indicates that the direction is invalid.

This function queries current know location. It's updated from time to time. To receive a script call when new location is available, please use CoreLocation.SetUpdateLocationHandler.

See also

58.12 CoreLocation.description

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.description")

Result Returns description.

Description

A string of the form "«latitude>, <longitude>» +/- <accuracy>m (speed <speed>kph / heading <heading>) @ <date-time>", where <latitude>, <longitude>, <accuracy>, <speed>, and <heading>are formatted floating point numbers and <date-time>is a formatted date string that includes date, time, and time zone information.

The returned string is intended for display purposes only.

This function queries current know location. It's updated from time to time. To receive a script call when new location is available, please use CoreLocation.SetUpdateLocationHandler.

Created 18th August 2014, last changed 18th August 2014.

58.14 CoreLocation.dismissHeadingCalibrationDisplay

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	No	No	No	No	Yes

MBS("CoreLocation.dismissHeadingCalibrationDisplay")

Result Returns OK or error.

Description

Core Location uses the heading calibration alert to calibrate the available heading hardware as needed. The display of this view is automatic, assuming your delegate supports displaying the view at all. If the view is displayed, you can use this method to dismiss it after an appropriate amount of time to ensure that your app's user interface is not unduly disrupted.

Created 17th February 2019, last changed 17th February 2019.

58.15 CoreLocation.distanceFilter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.distanceFilter")

Result Returns value or error.

Description

See also

- 58.28 CoreLocation.setDistanceFilter

1697

Created 18th August 2014, last changed 18th August 2014.

58.16 CoreLocation.distanceFromLocation

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.distanceFromLocation"; latitude; longitude)

Parameters

latitude

The latitude value for the geo coordinate.

51.50939

longitude

The latitude value for the geo coordinate.

-0.11832

Result Returns distance in meters.

Description

This method measures the distance between the two locations by tracing a line between them that follows the curvature of the Earth. The resulting arc is a smooth curve and does not take into account specific altitude changes between the two locations.

Examples

Return distance from London

MBS("CoreLocation.distanceFromLocation"; 51.50939, -0.11832)

Example Databases

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.headingAvailable")

Result Returns 1 if heading data is available; 0 if it is not.

Description

Heading data may not be available on Macs.

Example Databases

- [Mac and iOS/CoreLocation/CoreLocation](#)

Created 18th August 2014, last changed 18th August 2014.

58.19 CoreLocation.horizontalAccuracy

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.horizontalAccuracy")

Result Returns the horizontal accuracy value.

Description

The location's latitude and longitude identify the center of the circle, and this value indicates the radius of that circle. A negative value indicates that the location's latitude and longitude are invalid.

This function queries current know location. It's updated from time to time. To receive a script call when new location is available, please use CoreLocation.SetUpdateLocationHandler.

See also

58.21 CoreLocation.locationServicesEnabled

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.locationServicesEnabled")

Result Returns 1 if location services are enabled or 0 if they are not.

Description

The user can enable or disable location services altogether from the Settings application by toggling the switch in Settings >General >Location Services.

You should check the return value of this method before starting location updates to determine if the user has location services enabled for the current device. If this method returns 0 and you start location updates anyway, the Core Location framework prompts the user with a confirmation panel asking whether location services should be reenabled.

Example Databases

58.23 CoreLocation.purpose

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.purpose")

Result Returns the purpose text.

Description

If the value of this property is non-nil, the system includes the string in the dialog that asks the user whether it is all right for your application to use location services. The string gives you a chance to explain the reason for why your application is using location services.

You must set the value of this property prior to calling the `CoreLocation.startUpdatingLocation` method. Because the string is ultimately displayed to the user, you should always load it from a localized strings file. Available in Mac OS X v10.7 and later.

58.24 CoreLocation.requestAlwaysAuthorization

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	No	No	No	No	Yes

MBS("CoreLocation.requestAlwaysAuthorization")

Result Returns OK or error.

Description

When the current authorization status is notDetermined, this method runs asynchronously and prompts the user to grant permission to the app to use location services. The user prompt contains the text from the NSLocationAlwaysUsageDescription key in your app's Info.plist file, and the presence of that key is required when calling this method.

58.25 CoreLocation.requestLocation

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	No	No	No	No	Yes

MBS("CoreLocation.requestLocation")

Result Returns OK or error.

Description

This method returns immediately. Calling it causes the location manager to obtain a location fix (which may take several seconds).

See also

- 58.17 CoreLocation.hasLocation

1686

Created 17th February 2019, last changed 17th February 2019.

58.26 CoreLocation.requestWhenInUseAuthorization

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	No	No	No	No	Yes

MBS("CoreLocation.requestWhenInUseAuthorization")

Result Returns OK or error.

Description

When the current authorization status is notDetermined, this method runs asynchronously and prompts the user to grant permission to the app to use location services. The user prompt contains the text from the NSLocationWhenInUseUsageDescription key in your app's Info.plist file, and the presence of that key is required when calling this method.

58.27 CoreLocation.setDesiredAccuracy

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.setDesiredAccuracy"; Accuracy)

Parameters

Accuracy

The new value. Can be a number or the following text strings: Best, NearestTenMeters, HundredMeters, Kilometer and ThreeKilometers. Default is "best".

123

Result Returns OK or error.

Description

The receiver does its best to achieve the requested accuracy; however, the actual accuracy is not guaranteed. You should assign a value to this property that is appropriate for your usage scenario. In other words, if you need only the current location within a few kilometers, you should not specify "best" for the accuracy. Determining a location with greater accuracy requires more time and more power.

When requesting high accuracy location data, the initial event delivered by the location service may not have the accuracy you requested. The location service delivers the initial event as quickly as possible. It then continues to determine the location with the accuracy you requested and delivers additional events, as necessary, when that data is available.

58.28 CoreLocation.setDistanceFilter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.setDistanceFilter"; value)

Parameters

value

The distance. Either a number or text "none".

123

Result Returns OK or error.

Description

This distance is measured relative to the previously delivered location. Use the value "none" to be notified of all movements.

The default value of this property is "none".

See also

- 58.15 CoreLocation.distanceFilter

1684

Created 18th August 2014, last changed 18th August 2014.

58.29 CoreLocation.setPurpose

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.setPurpose"; text)

Parameters

text

Your purpose message.

"For tracking your location."

Result Returns "OK" or error.

Description

If the value of this property is non-nil, the system includes the string in the dialog that asks the user whether it is all right for your application to use location services. The string gives you a chance to explain the reason for why your application is using location services.

You must set the value of this property prior to calling the `CoreLocation.startUpdatingLocation` method. Because the string is ultimately displayed to the user, you should always load it from a localized strings file. Available in Mac OS X v10.7 and later.

58.30 CoreLocation.significantLocationChangeMonitoringAvailable

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.significantLocationChangeMonitoringAvailable")

Result Returns 1 if location change monitoring is available; 0 if it is not.

Description

This method indicates whether the device is able to report updates based on significant location changes only. (Significant location change monitoring primarily involves detecting changes in the cell tower currently associated with the device.) This capability provides tremendous power savings for applications that want to track a user's approximate location and do not need highly accurate position information.

Example Databases

Created 18th August 2014, last changed 18th August 2014.

58.31 CoreLocation.speed

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.speed")

Result Returns speed value.

Description

This value reflects the instantaneous speed of the device in the direction of its current heading. A negative value indicates an invalid speed. Because the actual speed can change many times between the delivery of subsequent location events, you should use this property for informational purposes only.

This function queries current know location. It's updated from time to time. To receive a script call when new location is available, please use CoreLocation.SetUpdateLocationHandler.

Created 18th August 2014, last changed 18th August 2014.

58.32 CoreLocation.startMonitoringSignificantLocationChanges

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.startMonitoringSignificantLocationChanges")

Result Returns OK or error.

Description

This method initiates the delivery of location events asynchronously, returning shortly after you call it. Location events are delivered to your didUpdateLocation script. The first event to be delivered is usually the most recently cached location event (if any) but may be a newer event in some circumstances. Obtaining a current location fix may take several additional seconds, so be sure to check the timestamps on the location events in your delegate method.

Your fail script may be called if an error occurs.

- 58.35 CoreLocation.stopMonitoringSignificantLocationChanges

1704

Created 18th August 2014, last changed 18th August 2014.

58.33 CoreLocation.startUpdatingHeading

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	No	No	No	No	Yes

MBS("CoreLocation.startUpdatingHeading")

Result Returns OK or error.

Description

This method returns immediately. Calling this method when the receiver is stopped causes it to obtain an initial heading and notify your delegate. After that, the receiver generates update events when the value in the headingFilter property is exceeded.

Before calling this method, you should always check the headingAvailable property to see whether heading information is supported on the current device. If heading information is not supported, calling this method has no effect and does not result in the delivery of events to your delegate.

Calling this method several times in succession does not automatically result in new events being generated. Calling stopUpdatingHeading() in between, however, does cause a new initial event to be sent the next time you call this method.

If you start this service and your app is suspended, the system stops the delivery of events until your app starts running again (either in the foreground or background). If your app is terminated, the delivery of new heading events stops altogether and must be restarted by your code when the app is relaunched.

58.34 CoreLocation.startUpdatingLocation

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.startUpdatingLocation")

Description

This method returns immediately. Calling this method when the receiver is stopped causes it to obtain an initial location fix (which may take several seconds) and notify your script. After that, the receiver generates update events primarily when the value in the distanceFilter property is exceeded. Updates may be delivered in other situations though. For example, the receiver may send another notification if the hardware gathers a more accurate location reading.

Calling this method several times in succession does not automatically result in new events being generated. Calling stopUpdatingLocation in between, however, does cause a new initial event to be sent the next time you call this method.

Available in Mac OS X v10.6 and later.

58.35 CoreLocation.stopMonitoringSignificantLocationChanges

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	2.7	Yes	No	Yes, macOS only	No	Yes

MBS("CoreLocation.stopMonitoringSignificantLocationChanges")

Result Returns OK or error.

Description

Use this method to stop the delivery of location events that was started using the CoreLocation.startMonitoringSignificantLocationChanges method.

See also

- 58.32 CoreLocation.startMonitoringSignificantLocationChanges 1701

Created 18th August 2014, last changed 18th August 2014.

58.36 CoreLocation.stopUpdatingHeading

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
58 CoreLocation	9.1	No	No	No	No	Yes

MBS("CoreLocation.stopUpdatingHeading")

Result Returns OK or error.

Description

Call this method whenever your code no longer needs to receive heading-related events. Disabling event delivery gives the receiver the option of disabling the appropriate hardware (and thereby saving power) when no clients need location data. You can always restart the generation of heading updates by calling the startUpdatingHeading() method again.

See also

- 58.33 CoreLocation.startUpdatingHeading 1702

Chapter 59

CoreML

macOS 10.13 and iOS 11 functions for machine learning.

59.1 CoreML.AddArrayParameter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.AddArrayParameter"; CoreMLRef; Name; Values; Type)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"test"

Values

The list with values.

"1\$3\$5"

Type

The type of array to pass. Can be Double, Float or Int32.

"Int32"

Result Returns OK or error.

Description

See also

- 59.2 CoreML.AddDoubleParameter 1711
- 59.3 CoreML.AddImageParameter 1712
- 59.4 CoreML.AddIntegerParameter 1714
- 59.5 CoreML.AddTextParameter 1715

Created 16th September 2017, last changed 16th September 2017.

59.2 CoreML.AddDoubleParameter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.AddDoubleParameter"; CoreMLRef; Name; Value)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"test"

Value

The value to use.

123

Result Returns OK or error.

Description

See also

Created 16th September 2017, last changed 16th September 2017.

59.3 CoreML.AddImageParameter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.AddImageParameter"; CoreMLRef; Name; Image)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"test"

Image

A container value with image content. Can be PNG, JPEG, GIF, TIFF, BMP or various other types.

Result Returns OK or error.

Description

Please make sure that the image has the required size.

Version 8.4 automatically scales image to required size.

Examples

Add image parameter:

Set Variable [\$r ; Value: MBS("CoreML.AddImageParameter"; \$\$ML; "image"; CoreML::Input Picture)]

59.4 CoreML.AddIntegerParameter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.AddIntegerParameter"; CoreMLRef; Name; Value)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"test"

Value

The value to use.

123

Result Returns OK or error.

Description

59.5 CoreML.AddTextParameter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.AddTextParameter"; CoreMLRef; Name; Value)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"test"

Value

The text value to use.

"Hello"

Result Returns OK or error.

Description

See also

59.6 CoreML.AddUndefinedParameter

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.AddUndefinedParameter"; CoreMLRef; Name { ; Type })

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"test"

Type

Optional

Default value type to use is invalid. Can be Int64, Double, Text, Image or Array.

"Text"

Result Returns OK or error.

Description

See also

- 59.4 CoreML.AddIntegerParameter

1714

Created 16th September 2017, last changed 16th September 2017.

59.7 CoreML.Available

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.Available")

Result Returns 1, 0 or error.

Description

Should return 1 on macOS 10.13 or newer or 0 on other versions.

Examples

Check availability:

```
If [ MBS("CoreML.Available") = 1 ]
Show Custom Dialog [ "Core ML not available" ; "Please run on macOS 10.13 High Sierra" ]
Exit Script [ Text Result: "" ]
End If
```

Example Databases

- [Mac and iOS/Machine Learning/Core ML Photos](#)
- [Mac and iOS/Machine Learning/CoreML](#)

Created 16th September 2017, last changed 16th September 2017.

59.8 CoreML.Clear

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.Clear"; CoreMLRef)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Result Returns OK or error.

Description

Examples

Clear parameters:

```
Set Variable [ $r ; Value: MBS("CoreML.Clear"; $$ML) ]
```

See also

59.9 CoreML.CompileModel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.CompileModel"; Path)

Parameters

Path

The native file path to the model.

"/Users/cs/Desktop/test.mlmodel"

Result Returns OK or error.

Description

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Compile model when needed:

```

If [ Right ( CoreML::Model Path; 8 ) = ".mlmodel" ]
Set Variable [ $r ; Value: MBS("CoreML.CompileModel"; CoreML::Model Path) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to compile" ; $r ]
Set Variable [ $$ML ; Value: "" ]
Else
Set Field [ CoreML::Model Path ; $r ]
End If
End If

```

Compile a model:

```
MBS( "CoreML.CompileModel"; "/Users/cs/Desktop/UpdatableDrawingClassifier.mlmodel" )
```

59.10 CoreML.Description

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.Description"; CoreMLRef)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Result Returns JSON or error.

Description

This is returned as a JSON block.

Common keys include predictedFeatureName, predictedProbabilitiesName, metadata, inputDescriptionsByName and outputDescriptionsByName.

Added isUpdatable key in v10.0 to indicate whether model can be updated.

Includes trainingInputDescriptionsByName and parameterDescriptionsByKey For MacOS 10.15 to provide details on training input and parameters.

Examples

Query description:

```
Set Field [ CoreML::Model Description ; MBS("CoreML.Description"; $$ML) ]
```

```
Example result: {
  "predictedProbabilitiesName" : "classLabelProbs",

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.OpenModel"; Path)

Parameters

Path

The path to the model file.

"/test.mlmodelc"

Result Returns OK or error.

Description

If the model is not compiled (*.mlmodel), you can compile it with CoreML.CompileModel. Returns error message if there is a problem.

See also Vision.ClassifyImage to use Vision framework from Apple to classify images with Apple's model.

Examples

Load Model:

```
Set Variable [ $$ML ; Value: MBS("CoreML.OpenModel"; CoreML::Model Path) ]
If [ MBS("IsError") ]
Show Custom Dialog [ "Failed to load" ; $$ML ]
Set Variable [ $$ML ; Value: "" ]

59.13 CoreML.PredictionFromFeatures

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.PredictionFromFeatures"; CoreMLRef)

Parameters

CoreMLRef

The reference number to the model.

\$Model

Result Returns JSON or error.

Description

Returns JSON with the result from the model.

The result is stored for later query result images via CoreML.ResultImage.

See also Vision.ClassifyImage to use Vision framework from Apple to classify images with Apple's model.

Examples

Run model:

```

If [ Length ( $$ML ) = 0 ]
Show Custom Dialog [ "Please load model first." ]
Exit Script [ Text Result: "" ]
End If
Set Variable [ $r ; Value: MBS("CoreML.Clear"; $$ML) ]

59.15 CoreML.ResultImage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.ResultImage"; CoreMLRef; Name { ; ImageType; Filename })

Parameters

CoreMLRef

The reference number to the model.

\$Model

Name

The name of the parameter.

"image"

ImageType

Optional

The type of image to return. Either JPEG, PNG, GIF or BMP. Default is JPEG.

"JPEG"

Filename

Optional

The filename to use for the picture. Default is "image" with the extension matching the image type.

"test.jpg"

Result Returns container value or error.

Description

If the CoreML.PredictionFromFeatures returns result and there is an image included, you can query it here.

See also

- 59.13 CoreML.PredictionFromFeatures

1727

Created 16th September 2017, last changed 16th September 2017.

59.16 CoreML.SetUsesCPUOnly

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	7.4	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.SetUsesCPUOnly"; CoreMLRef; Value)

Parameters**CoreMLRef**

The reference number to the model.

\$Model

Value

The new setting. 1 = CPU only 0 = CPU and GPU (Default)

1

Result Returns OK or error.

Description

Set to 1 to disable GPU and only do processing on CPU.

Pass 0 (default) to use both.

See also

- 59.11 CoreML.GetUsesCPUOnly

1724

Created 16th September 2017, last changed 16th September 2017.

59.17 CoreML.Update

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
59 CoreML	10.0	Yes	No	Yes, macOS only	No	Yes

MBS("CoreML.Update"; InputPath; OutputPath; trainingData)

Parameters

InputPath

The input path to the model file.

"/test.mlmodel"

OutputPath

The output path to the model file.

"/output.mlmodel"

trainingData

The new training data as JSON array.

Result Returns OK or error.

Description

Update a machine learning model on a user's device. Pass in path to existing model and path for new model. Training data is a JSON array. Each entry is an object with the input and output keys. Each key has a value, either a number or text, array or image path. The image is defined with a native file path and format is automatically adjusted.

Look in CoreML.Description for the inputDescriptionsByName, outputDescriptionsByName and trainingInputDescriptionsByName. The constrains may tell you what image sizes to use.

Examples

Update a model:

```
MBS( "CoreML.Update"; "/Users/cs/Desktop/UpdatableDrawingClassifier.mlmodelc"; "/Users/cs/Desktop/UpdatableDrawingClassifier2.mlmodelc"; " [ { \"drawing\": \"/Users/cs/Desktop/mbslogo.png\", \"label\": \"car\" } ] " )
```

Chapter 60

CUPS

Print RAW data on Mac OS X (for label printers).

You can send raw commands to label printers. Or print a file directly to a printer. For a laser printer you may also send directly PostScript or PDF data.

60.1 CUPS.CancelJob

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.CancelJob"; name; JobID)

Parameters

name

Name of the printer.

"Brother_DCP_8085DN"

JobID

The job number of the job you want to cancel. Pass -1 to cancel all jobs or 0 to cancel current job.

123

Result Returns 1 on success, 0 on failure.

Description

Examples

Cancel all jobs on this printer queue:

MBS("CUPS.CancelJob"; "Brother_DCP_8085DN"; -1)

See also

- 60.19 CUPS.LastErrorCode 1753
- 60.20 CUPS.LastErrorMessage 1754

Created 18th August 2014, last changed 18th August 2014.

60.2 CUPS.GetDefaultPrinterName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetDefaultPrinterName")

Result The name of the default printer.

Description

This function returns the default printer or class as defined by the LPDEST or PRINTER environment variables. If these environment variables are not set, the server default destination is returned.

Returns empty string if no default printer is defined.

Examples

Query default printer name:

```
$result = MBS( "CUPS.GetDefaultPrinterName" )
```

Created 18th August 2014, last changed 18th August 2014.

60.3 CUPS.GetJobCompletionTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetJobCompletionTime"; index)

Parameters

index

Index in the jobs list. Value from 0 to CUPS.GetJobsCount-1.
0

Result The completion time.

Description

Please call CUPS.GetJobsCount once before you call this function.

See also

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetJobCreationTime"; index)

Parameters

index

Index in the jobs list. Value from 0 to CUPS.GetJobsCount-1.
0

Result The creation time.

Description

Please call CUPS.GetJobsCount once before you call this function.

60.5 CUPS.GetJobFormat

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetJobFormat"; index)

Parameters

index

Index in the jobs list. Value from 0 to CUPS.GetJobsCount-1.

0

Result The document format.

Description

Please call CUPS.GetJobsCount once before you call this function.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetJobID"; index)

Parameters

index

Index in the jobs list. Value from 0 to CUPS.GetJobsCount-1.

0

Result Returns job number, empty or error.

Description

Please call CUPS.GetJobsCount once before you call this function.

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	7.4	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetJobIndex"; JobID)

Parameters

JobID

The job ID.

123

Result Returns job index, empty or error.

Description

You can use this function to quickly locate a job by ID in the list of jobs.

Please call CUPS.GetJobsCount once before you call this function.

Created 18th August 2014, last changed 18th August 2014.

60.15 CUPS.GetJobsCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

```
MBS( "CUPS.GetJobsCount" { ; Name; OnlyMyJobs; whichJobs } )
```

Parameters

Name

Optional

Name of the printer queue to query. If no name or empty string is specified, we get all queues.

"Brother_DCP_8085DN"

OnlyMyJobs

Optional

Pass either "my" for your users jobs or "all" for all jobs.

"all"

whichJobs

Optional

Pass "active" to get only active jobs, "all" for all jobs or "complete" for completed jobs.

"complete"

Result The number of jobs found.

Description

First call this function to build job list. Than call other GetJob* functions to query values.

With indexes from 0 to count-1, you can call the other functions CUPS.GetJobState, CUPS.GetJobCompletionTime, CUPS.GetJobCreationTime, CUPS.GetJobProcessingTime, CUPS.GetJobPrinter, CUPS.GetJobID, CUPS.GetJobTitle, CUPS.GetJobPriority, CUPS.GetJobFormat, CUPS.GetJobSize and CUPS.GetJobUser.

Examples

Query all jobs:

```
MBS( "CUPS.GetJobsCount"; ""; "all"; "all" )
```

60.15.1 FileMaker Magazin

- Ausgabe 6/2017, Seite 25

Created 18th August 2014, last changed 5th July 2015.

60.16 CUPS.GetPrinterCount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetPrinterCount")

Result The number of printers.

Description

Please call this method before calling CUPS.GetPrinterDefault or CUPS.GetPrinterName.

Examples

Query number of printers

```
$count = MBS( "CUPS.GetPrinterCount" )
```

See also

- 60.17 CUPS.GetPrinterDefault 1751
- 60.18 CUPS.GetPrinterName 1752

Created 18th August 2014, last changed 18th August 2014.

60.17 CUPS.GetPrinterDefault

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetPrinterDefault"; index)

Parameters

index

Index of the printer. Value is between 0 and CUPS.GetPrinterCount-1.
0

Result A boolean value. True if the printer is the default printer.

Description

Examples

Get default state of 3rd printer:

MBS("CUPS.GetPrinterDefault"; 2)

See also

- 60.16 CUPS.GetPrinterCount

1750

60.18 CUPS.GetPrinterName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.GetPrinterName"; index)

Parameters

index

Index of the printer. Value is between 0 and CUPS.GetPrinterCount-1.
0

Result The name of the printer.

Description

Examples

Get name of 3rd printer:

MBS("CUPS.GetPrinterName"; 2)

See also

- 60.16 CUPS.GetPrinterCount

1750

Example Databases

Created 18th August 2014, last changed 18th August 2014.

60.19 CUPS.LastErrorCode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.LastErrorCode")

Result Last error code.

Description

Examples

This cancels a job and queries last error code (will be 1030) and error message (something like "job 123 doesn't exist"):

```
$result = MBS( "CUPS.CancelJob"; "test"; 123 )
$message = MBS( "CUPS.LastErrorMessage" )
$errorCode = MBS( "CUPS.LastErrorCode" )
```

See also

- 60.1 CUPS.CancelJob 1733

Created 18th August 2014, last changed 18th August 2014.

60.20 CUPS.LastErrorMessage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

MBS("CUPS.LastErrorMessage")

Result Error message text.

Description

Examples

This cancels a job and queries last error code (will be 1030) and error message (something like "job 123 doesn't exist"):

```
$result = MBS( "CUPS.CancelJob"; "test"; 123 )
$message = MBS( "CUPS.LastErrorMessage" )
$errorCode = MBS( "CUPS.LastErrorCode" )
```

See also

- 60.1 CUPS.CancelJob 1733

Created 18th August 2014, last changed 18th August 2014.

60.21 CUPS.PrintData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	2.5	Yes	No	Yes, macOS only	No	No

```
MBS( "CUPS.PrintData"; Printer; Data { ; Title; Options } )
```

Parameters

Printer

The name of the printer.

```
"Brother_DCP_8085DN"
```

Data

The file data to print. You can include escapes with backslash. \n gives new line, \r gives return, \\ gives a backslash. \xx with a hex number gives that character. e.g. \41 gives an A.

```
"Hello World\nJust a test!\n"
```

Title

Optional

The title of the print job.

```
"FileMaker Printout"
```

Options

Optional

List of options. Simply add key and values as string parameters to the function call.

```
"key1"; "value1"; "key2"; "value2"
```

Result Returns job number.

Description

With \xx you can embed any character in the text.

\t gives a tab, \n a LF, \r a newline.

Examples

Print data:

```
MBS( "CUPS.PrintData"; "Brother_DCP_8085DN"; "Hello World\nJust a test!\n"; "FileMaker Printout" )
```

Print data with options:

```
MBS( "CUPS.PrintData"; "Brother_DCP_8085DN"; "Hello World\nJust a test!\n"; "FileMaker Printout";
// first option
"Scaling"; "75";
// second option
"media"; "A4" )
```

Build Data, send to printer and write a text file for debugging:

```
Set Variable [ $data; Value:"# !A1# DC REM Drucker wird aktiviert$" & "# IMSR103.87/25.00 REM
Etikettenmasse$" & "# PR5/5/ REM Druckgeschwindigkeit$" & "# HV70 REM Druckhitze$" & "# ER$"
& "$" & "$" & "$" & "$" & "# T06.5 # J18.7 # YN101/1R/33//\80# G$" ... ]
Set Variable [ $data; Value:MBS( "Text.ReplaceNewline"; $data; 3 ) ]
Set Variable [ $r; Value:MBS( "Text.WriteTextFile"; $data; "/tmp/test.txt"; "Dos" ) ]
Set Variable [ $r; Value:MBS( "CUPS.PrintData"; "LabelPrinter"; $data; "Label" ) ]
```

60.22 CUPS.PrintDataEncoding

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
60 CUPS	6.3	Yes	No	Yes, macOS only	No	No

MBS("CUPS.PrintDataEncoding"; Printer; Data; Encoding { ; Title; Options })

Parameters

Printer

The name of the printer.

"Brother_DCP_8085DN"

Data

The file data to print. You can include escapes with backslash. \n gives new line, \r gives return, \\ gives a backslash. \xx with a hex number gives that character. e.g. \41 gives an A.

"Hello World\nJust a test!\n"

Encoding

The text encoding for data.

"UTF-8"

Title

Optional

The title of the print job.

"FileMaker Printout"

Options

Optional

List of options. Simply add key and values as string parameters to the function call.

"key1"; "value1"; "key2"; "value2"

Result Returns OK or error.

Description

With \xx you can embed any character in the text.

\t gives a tab, \n a LF, \r a newline.

Examples

Sends some data in Windows encoding:

```
Set Variable [ $data; Value:"Hello World.§Tägliche Grüße!" ]
Set Variable [ $data; Value:MBS( "Text.ReplaceNewline"; $data; 3 ) ]
Set Variable [ $r; Value:MBS( "Text.WriteTextFile"; $data; "/tmp/test.txt"; "Windows" ) ]
Set Variable [ $r; Value:MBS( "CUPS.PrintDataEncoding"; "Brother_DCP_8085DN"; $data; "Windows";
"Test Print" ) ]
```

Created 18th August 2014, last changed 25th February 2017.

Chapter 61

CURL

Up- and Download with FTP/SFTP/FTPS/HTTP/HTTPS.

You can use CURL functions for webservice, ftp uploads, directory listing and other network tasks.

61.1 CURL.AddInputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.7	Yes	Yes	Yes	Yes	Yes

MBS("CURL.AddInputFile"; curl; data)

Parameters

curl

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Using SetInput* functions and AddInput* functions you can construct the input data in several function calls. This is useful if you do a multipart upload with text parts and file content mixed.

This is for adding to existing data, but for uploading only a file, you can use CURL.SetInputFile. If you have a file path, please use CURL.OpenInputFile instead.

Examples

Add container:

```
MBS( "CURL.AddInputFile"; $curl; MyTable::MyContainer )
```

61.2 CURL.AddInputGIF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	3.1	Yes	Yes	Yes	Yes	Yes

MBS("CURL.AddInputGIF"; curl; data)

Parameters

curl

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Using SetInput* functions and AddInput* functions you can construct the input data in several function calls. This is useful if you do a multipart upload with text parts and file content mixed.

This is for adding to existing data, but for uploading only a file, you can use CURL.SetInputGIF.

Examples

Add GIF picture from container:

```
MBS( "CURL.AddInputGIF"; $curl; MyTable::MyContainer )
```

61.3 CURL.AddInputJPEG

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.7	Yes	Yes	Yes	Yes	Yes

MBS("CURL.AddInputJPEG"; curl; data)

Parameters

curl

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Using SetInput* functions and AddInput* functions you can construct the input data in several function calls. This is useful if you do a multipart upload with text parts and file content mixed.

This is for adding to existing data, but for uploading only a file, you can use CURL.SetInputJPEG.

Examples

Add JPEG picture from container:

```
MBS( "CURL.AddInputJPEG"; $curl; MyTable::MyContainer )
```

61.4 CURL.AddInputPDF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	4.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.AddInputPDF"; curl; data)

Parameters

curl

The CURL session handle.

\$curl

data

The container value with the data to upload.

\$pdfContainer

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Using SetInput* functions and AddInput* functions you can construct the input data in several function calls. This is useful if you do a multipart upload with text parts and file content mixed.

This is for adding to existing data, but for uploading only a file, you can use CURL.SetInputPDF.

Examples

Add PDF from container:

```
MBS( "CURL.AddInputPDF"; $curl; MyTable::MyContainer )
```

61.5 CURL.AddInputPNG

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.7	Yes	Yes	Yes	Yes	Yes

MBS("CURL.AddInputPNG"; curl; data)

Parameters

curl

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Using SetInput* functions and AddInput* functions you can construct the input data in several function calls. This is useful if you do a multipart upload with text parts and file content mixed.

This is for adding to existing data, but for uploading only a file, you can use CURL.SetInputPNG.

Examples

Add PNG picture from container:

```
MBS( "CURL.AddInputPNG"; $curl; MyTable::MyContainer )
```

61.6 CURL.AddInputText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.7	Yes	Yes	Yes	Yes	Yes

MBS("CURL.AddInputText"; curl; text { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

text

The text to send.

Encoding

Optional

The text encoding. Default is UTF-8 for version 10.0 or newer and native encoding before.

UTF8

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Please make sure you choose the text encoding the other side expects.

Using SetInput* functions and AddInput* functions you can construct the input data in several function calls. This is useful if you do a multipart upload with text parts and file content mixed.

This is for adding to existing data, but for uploading only a file, you can use CURL.SetInputText.

Examples

Add Text:

```
MBS("CURL.AddInputText"; $curl; "Hello World"; "utf8")
```

61.7 CURL.Cancel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Cancel"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns "OK" on success.

Description

Technically set a flag so the background thread will quit soon. Can take a second till transfer ends. Only useful with CURL.PerformInBackground.

Examples

Cancels a transfer running async or in background:

MBS("CURL.Cancel"; \$curl)

See also

Created 18th August 2014, last changed 7th December 2016.

61.8 **CURL.Check**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Check")

Result Returns OK or error.

Description

You can call this on a server in a loop to have asynchronous perform call work.

Examples

Checks CURL transfers for events:

MBS("CURL.Check")

Created 12nd July 2015, last changed 12nd July 2015.

61.9 CURL.Cleanup

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Cleanup"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns "OK" on success or error on failure.

Description

This function must be the last function to call for a CURL session. It is the opposite of the CURL.New function and must be called with the same handle as input that the CURL.New call returned.

This will effectively close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files.

Any uses of the handle after this function has been called and have returned, are illegal. This kills the handle and all memory associated with it!

Please don't try to close a running transfer.

Examples

Cleanup session:

```
# for every New call
$curl = MBS( "CURL.New"
```

```
# work with $curl
```

```
# you need a cleanup call on the end
MBS( "CURL.Cleanup"; $curl )
```

Download URL to temp file:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
# this is URL to download
Set Variable [ $url; Value:"https://www.monkeybreadsoftware.com/filemaker/test.txt" ]
# get file name from URL
Set Variable [ $name; Value:MBS( "Path.LastPathComponent"; $URL ) ]
# now make temp file path
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; MBS( "Folders.SystemTemporary" ); $name
) ]
# set URL to download
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; $url) ]
# open destination file
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
```

```

# run transfer
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# close destination file
Set Variable [ $r; Value:MBS("CURL.CloseOutputFile"; $curl) ]
# get debug messages
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

61.10 **CURL.CloseDebugFile**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CloseDebugFile"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns "OK" on success or error message.

Description

To create file for debug messages use `CURL.CreateDebugOutputFile` function.

The plugin closes files automatically when you call `CURL.Cleanup`.

Do not call this method while a transfer is running.

In case close operation itself fails, the result is a number with the native file system error code.

Examples

Close debug log file:

```
MBS("CURL.CloseDebugFile"; $curl)
```

61.11 CURL.CloseHeaderFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CloseHeaderFile"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns "OK" on success or error message.

Description

To create file for header messages use CURL.CreateHeaderOutputFile function.

The plugin closes files automatically when you call CURL.Cleanup.

Do not call this method while a transfer is running.

In case close operation itself fails, the result is a number with the native file system error code.

Examples

Close header file:

```
MBS("CURL.CloseHeaderFile"; $curl)
```

61.12 **CURL.CloseInputFile**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CloseInputFile"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns "OK" on success or error message.

Description

To open file for reading data use `CURL.OpenInputFile` function.

The plugin closes files automatically when you call `CURL.Cleanup`.

Do not call this method while a transfer is running.

In case close operation itself fails, the result is a number with the native file system error code.

Examples

Close input file:

```
MBS("CURL.CloseInputFile"; $curl)
```

61.13 CURL.CloseOutputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CloseOutputFile"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns "OK" on success or error message.

Description

To create file for data use CURL.CreateOutputFile function.

The plugin closes files automatically when you call CURL.Cleanup.

Do not call this method while a transfer is running.

In case close operation itself fails, the result is a number with the native file system error code.

Examples

Download URL to temp file:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
# this is URL to download
Set Variable [ $url; Value:"https://www.monkeybreadsoftware.com/filemaker/test.txt" ]
# get file name from URL
Set Variable [ $name; Value:MBS( "Path.LastPathComponent"; $URL ) ]
# now make temp file path
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; MBS( "Folders.SystemTemporary" ); $name
) ]
# set URL to download
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; $url ) ]
# open destination file
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
# run transfer
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# close destination file
Set Variable [ $r; Value:MBS("CURL.CloseOutputFile"; $curl) ]
# get debug messages
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Close output file:

```
MBS("CURL.CloseOutputFile"; $curl)
```

61.14 CURL.CreateDebugOutputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CreateDebugOutputFile"; curl; Path)

Parameters

curl

The CURL session handle.

\$curl

Path

Native file path.

C:\Documents\Test.Txt

Result Returns "OK" on success or error message.

Description

Debug messages are written to file if you use this functions and debug messages are always collected for calling `CURL.GetDebugAsText` after the transfer. This can be useful as you can have your FileMaker solution write a copy of debug messages in temporary file. If your client has problems, you can simply read messages from last transfer. If creation of the file fails, you get an error message back, but still your transfer will probably succeed.

Do not call this method while a transfer is running.

Logging to a file is useful to read messages in case FileMaker crashes while a transfer.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Write copy of debug messages to a file into temp folder on Mac:

```
MBS( "CURL.CreateDebugOutputFile"; $curl; "/tmp/LastMessages.txt" )
```

61.15 CURL.CreateHeaderOutputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CreateHeaderOutputFile"; curl; Path)

Parameters

curl

The CURL session handle.

\$curl

Path

Native file path.

C:\Documents\Test.Txt

Result Returns "OK" on success or error message.

Description

Header messages are written to file if you use this functions and header text are always collected for calling CURL.GetHeaderAsText after the transfer. This can be useful as you can have your FileMaker solution write a copy of headers in temporary file. If your client has problems, you can simply read headers from last transfer. If creation of the file fails, you get an error message back, but still your transfer will probably succeed.

Do not call this method while a transfer is running.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Write copy of header texts to a file into temp folder on Mac:

```
MBS( "CURL.CreateHeaderOutputFile"; $curl; "/tmp/LastHeaders.txt" )
```

61.16 CURL.CreateOutputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.CreateOutputFile"; curl; Path)

Parameters

curl

The CURL session handle.

\$curl

Path

Native file path.

C:\Documents\Test.Txt

Result Returns "OK" on success or error message.

Description

If you set MBS("CURL.SetOptionFileOnlyMode"; \$curl; 1), the data is only written to file and not available with CURL.GetResult* functions. If creation of the file fails, you get an error message back, but still your transfer will probably succeed.

Do not call this method while a transfer is running.

Sets CURL.SetOptionFileOnlyMode to 1 for version 9.3 or later automatically.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Write data to a file on Mac in temp folder:

```
MBS( "CURL.CreateOutputFile"; $curl; "/tmp/download.dat" )
```

Write data only to file on Windows:

```
MBS( "CURL.SetOptionFileOnlyMode"; $curl; 1 )
```

```
MBS( "CURL.CreateOutputFile"; $curl; "c:\download.dat" )
```

Download URL to temp file:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
```

```
# this is URL to download
```

```
Set Variable [ $url; Value:"https://www.monkeybreadsoftware.com/filemaker/test.txt" ]
```

```
# get file name from URL
```

```
Set Variable [ $name; Value:MBS( "Path.LastPathComponent"; $URL ) ]
```

```

# now make temp file path
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; MBS( "Folders.SystemTemporary" ); $name
) ]
# set URL to download
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.monkeybreadsoftware.com/file-
maker/test.txt" ) ]
# open destination file
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
# run transfer
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# close destination file
Set Variable [ $r; Value:MBS("CURL.CloseOutputFile"; $curl) ]
# get debug messages
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Download file via SFTP to file on disk:

```

Set Variable [ $curl; Value:MBS("CURL.New") ]
# set download URL, e.g. sftp://monkeybreadsoftware.net/test.jpg
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; SFTP Download::URL ) ]
# build file path on disk and open output file
Set Variable [ $name; Value:GetValue(SFTP Download::FileName; 1) ]
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; SFTP Download::FolderPath; $name ) ]
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
# login only via password
Set Variable [ $result; Value:MBS( "CURL.SetOptionSSHAuthTypes"; $curl; 2+8 ) ]
# set credentials
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; SFTP Download::UserName ) ]

# free CURL session
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Batch download a lot of files via FTP/SFTP:

```

# URL field contains ftp or sftp URL with / on end.
# FileList field contains list of files to load
# OutputPath field contains folder path on disk
#
Set Variable [ $i; Value:1 ]
Set Variable [ $max; Value:ValueCount ( SFTP Download::FileList ) ]
#
Set Variable [ $curl; Value:MBS("CURL.New") ]

```

```

#
# login only via password
Set Variable [ $result; Value:MBS( "CURL.SetOptionSSHAAuthTypes"; $curl; 2+8 ) ]
#
# set credentials
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; SFTP Download::UserName ) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; SFTP Download::Password ) ]
#
# start loop over file lists
Loop
#
Set Variable [ $name; Value:GetValue ( SFTP Download::FileList ; $i ) ]
#
# build file path on disk and open output file
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; SFTP Download::OutputPath; $name ) ]
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
#
# set URL with file name
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; SFTP Download::URL & $name ) ]
#
# run transfer
Set Field [ SFTP Download::ERGEBNIS; MBS("CURL.Perform"; $curl) ]
#
# query debug log
Set Field [ SFTP Download::DEBUG; MBS("CURL.GetDebugAsText"; $curl) ]
#
Set Variable [ $i; Value:$i +1 ]
Exit Loop If [ $max = $i ]
#
End Loop
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

61.17 CURL.ErrorCode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.ErrorCode"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result The last error code from CURL.

Description

Typical error codes are 6 for a wrong domain name in the URL, 67 for wrong name/password combination, 60 for missing SSL settings, 1 for an unsupported protocol.

The list of possible error codes:

Examples

On success puts download in container, else shows failed:

```
Set Variable [ $errorCode; Value:MBS("CURL.ErrorCode"; $curl) ]
Set Variable [ $httpResult; Value:MBS("CURL.GetResponseCode"; $curl) ]
Set Field [ Download Async::Result; $errorCode ]
Set Field [ Download Async::DebugMessages; MBS("CURL.GetDebugAsText"; $curl) ]
If [ $errorCode = 0 and $httpResult = 200 ]
Set Field [ Download Async::Progress; "Done" ]
Set Field [ Download Async::Output; MBS("CURL.GetResultAsContainer"; $curl) ]
Else
Set Field [ Download Async::Progress; "Failed" ]
Set Field [ Download Async::Output; "" ]
End If
```

Name	Number	Description
CURLE_OK	0	No error.
CURLE_UNSUPPORTED_PROTOCOL	1	Unsupported protocol.
CURLE_FAILED_INIT	2	Initialization failed or option not available.
CURLE_URL_MALFORMAT	3	URL has wrong format.
CURLE_COULDNT_RESOLVE_PROXY	5	DNS didn't return proxy IP.
CURLE_COULDNT_RESOLVE_HOST	6	DNS didn't return IP for host.
CURLE_COULDNT_CONNECT	7	Connection failed.
CURLE_FTP_WEIRD_SERVER_REPLY	8	FTP error.
CURLE_REMOTE_ACCESS_DENIED	9	A service was denied by the server due to lack of access when login fails this is not returned.
CURLE_FTP_WEIRD_PASS_REPLY	11	FTP error.
CURLE_FTP_WEIRD_PASV_REPLY	13	FTP error.
CURLE_FTP_WEIRD_227_FORMAT	14	FTP error.
CURLE_FTP_CANT_GET_HOST	15	FTP error.
CURLE_FTP_COULDNT_SET_TYPE	17	FTP set command failed.
CURLE_PARTIAL_FILE	18	Only a part of the file was downloaded.
CURLE_FTP_COULDNT_RETR_FILE	19	File not found.
CURLE_QUOTE_ERROR	21	quote command failure
CURLE_HTTP_RETURNED_ERROR	22	HTTP returned an error.
CURLE_WRITE_ERROR	23	Write error.
CURLE_UPLOAD_FAILED	25	failed upload "command"
CURLE_READ_ERROR	26	couldn't open/read from file
CURLE_OUT_OF_MEMORY	27	Out Of memory
CURLE_OPERATION_TIMEDOUT	28	the timeout time was reached
CURLE_FTP_PORT_FAILED	30	FTP PORT operation failed
CURLE_FTP_COULDNT_USE_REST	31	the REST command failed
CURLE_RANGE_ERROR	33	RANGE "command" didn't work
CURLE_HTTP_POST_ERROR	34	HTTP Post failed.
CURLE_SSL_CONNECT_ERROR	35	wrong when connecting with SSL
CURLE_BAD_DOWNLOAD_RESUME	36	couldn't resume download
CURLE_FILE_COULDNT_READ_FILE	37	Failed to read file.
CURLE_LDAP_CANNOT_BIND	38	LDAP can't connect.
CURLE_LDAP_SEARCH_FAILED	39	LDAP Search failed.
CURLE_FUNCTION_NOT_FOUND	41	Function not found.
CURLE_ABORTED_BY_CALLBACK	42	Transfer aborted with CURL.Cancel.
CURLE_BAD_FUNCTION_ARGUMENT	43	Bad parameters.
CURLE_INTERFACE_FAILED	45	CURL.OptionInterface failed
CURLE_TOO_MANY_REDIRECTS	47	catch endless re-direct loops
CURLE_UNKNOWN_TELNET_OPTION	48	User specified an unknown option
CURLE_TELNET_OPTION_SYNTAX	49	Malformed telnet option
CURLE_PEER_FAILED_VERIFICATION	51	peer's certificate or fingerprint wasn't verified fine
CURLE_GOT_NOTHING	52	when this is a specific error
CURLE_SSL_ENGINE_NOTFOUND	53	SSL crypto engine not found
CURLE_SSL_ENGINE_SETFAILED	54	can not set SSL crypto engine as default
CURLE_SEND_ERROR	55	failed sending network data
CURLE_RECV_ERROR	56	failure in receiving network data
CURLE_SSL_CERTPROBLEM	58	problem with the local certificate
CURLE_SSL_CIPHER	59	couldn't use specified cipher
CURLE_SSL_CACERT	60	problem with the CA cert (path?)
CURLE_BAD_CONTENT_ENCODING	61	Unrecognized transfer encoding
CURLE_LDAP_INVALID_URL	62	Invalid LDAP URL
CURLE_FILESIZE_EXCEEDED	63	Maximum file size exceeded
CURLE_USE_SSL_FAILED	64	Requested FTP SSL level failed
CURLE_SEND_FAIL_REWIND	65	Sending the data requires a rewind that failed
CURLE_SSL_ENGINE_INITFAILED	66	failed to initialise ENGINE
CURLE_LOGIN_DENIED	67	user, password or similar was not accepted and we failed to login
CURLE_TFTP_NOTFOUND	68	file not found on server
CURLE_TFTP_PERM	69	permission problem on server
CURLE_REMOTE_DISK_FULL	70	out of disk space on server
CURLE_TFTP_ILLEGAL	71	Illegal TFTP operation
CURLE_TFTP_UNKNOWNID	72	Unknown transfer ID
CURLE_REMOTE_FILE_EXISTS	73	File already exists
CURLE_TFTP_NOSUCHUSER	74	No such user
CURLE_CONV_FAILED	75	conversion failed
CURLE_CONV_REQD	76	caller must register conversion callbacks
CURLE_SSL_CACERT_BADFILE	77	could not load CACERT file, missing or wrong format
CURLE_REMOTE_FILE_NOT_FOUND	78	remote file not found
CURLE_SSH	79	error from the SSH layer, somewhat generic so the error message will be of interest when this has happened
CURLE_SSL_SHUTDOWN_FAILED	80	Failed to shut down the SSL connection
CURLE_AGAIN	81	socket is not ready for send/rcv, wait till it's ready and try again.
CURLE_SSL_CRL_BADFILE	82	could not load CRL file, missing or wrong format.
CURLE_SSL_ISSUER_ERROR	83	Issuer check failed.
CURLE_FTP_PRET_FAILED	84	a PRET command failed
CURLE_RTSP_CSEQ_ERROR	85	mismatch of RTSP CSeq numbers
CURLE_RTSP_SESSION_ERROR	86	mismatch of RTSP Session Identifiers

61.18 CURL.ErrorMessage

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.ErrorMessage"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result The last CURL error message.

Description**Examples**

Query Error Message:

```
Set Variable [ $ErrorMessage; Value:MBS( "CURL.ErrorMessage"; $curl ) ]
```

```
Show Custom Dialog [ "Transfer error"; $ErrorMessage ]
```

61.19 CURL.Features

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	10.1	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Features")

Result Returns JSON or error.

Description

Returns JSON with features enabled for the CURL version in use.

61.19.1 Blog Entries

- [MBS FileMaker Plugin, version 10.1pr4](#)

Created 12nd February 2020, last changed 12nd February 2020.

61.20 CURL.FileInfos

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FileInfos"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns JSON or error.

Description

Requires wild card being enabled (CURL.SetOptionWildCardMatch) and an URL with a pattern, e.g. * at the end.

Only for FTP and SFTP protocols.

The JSON is an array of objects. Each object includes the following values:

As various servers return different listings, we can not always know all fields.

Some servers don't give the year, so we assume this year and last year depending on month and day.

For MBS Plugin 9.0 or newer you can alternatively run a custom request "MLSD" and then get file infos, too.

Examples

Query file list with wildcard:

```
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $r ; Value: MBS( "CURL.SetOptionWildCardMatch"; $curl; 1 ) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL & "*" ) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionVerbose"; $curl; 1) ]
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::listing ; MBS( "JSON.Colorize"; MBS("CURL.FileInfos"; $curl) ) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]
```

Query file list with MLSD:

```
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $r ; Value: MBS( "CURL.SetOptionWildCardMatch"; $curl; 1 ) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL & "*" ) ]
```

hasFileName	Whether file name is known.
hasFiletype	Whether file type is known.
hasTime	Whether time is known.
hasPerm	Whether file permissions are known.
hasUID	Whether UID is known.
hasGID	Whether GID is known.
hasSize	Whether file size is known.
hasHardLinkCount	Whether hard link count is known.
FileName	The file name.
FileType	The file type. Usually file, directory or symlink.
Time	The time as returned from server.
Perm	The permissions as returned from server.
User	The user name as returned from server.
Group	The group name as returned from server.
Target	The target file path of the symbolic link.
HardLinks	The number of hard links to this file.
Size	The file size in bytes.
UID	The user ID if known.
GID	The group ID if known.
Permissions	The file permissions as octal number as text, e.g. 755.
TimeValue	The unix time stamp.
Year	The year of the time, if available.
Month	The month of the time, if available.
Day	The day of the time, if available.
Hour	The hour of the time, if available.
Minute	The minute of the time, if available.
Second	The second of the time, if available.

```

Set Variable [ $result ; Value: MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionVerbose"; $curl; 1) ]
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::listing ; MBS( "JSON.Colorize"; MBS("CURL.FileInfos"; $curl)) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]

61.21 CURL.FormAddKeyContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormAddKeyContainer"; curl; name; filename; container)

Parameters

curl

The CURL session handle.
\$curl

name

The name of the form field.
"city"

filename

The file name for this file.
"test.txt"

container

The file content as a container value. Can be PDF, PNG, GIF, BMP, JPEG or other file content.

Result Returns "OK" or error code.

Description

This adds file form field with a given name and value.

Please call CURL.FormFinish after you added all your fields and before you call CURL.Perform.

Examples

Add file from container:

```
MBS("CURL.FormAddKeyContainer"; $curl; "Attachment"; "paris.jpg"; Test::test)
```

61.23 CURL.FormAddKeyFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormAddKeyFile"; curl; name; Path)

Parameters

curl

The CURL session handle.

\$curl

name

The name of the form field.

"city"

Path

Native file path.

"/Users/cs/Desktop/test.txt"

Result Returns "OK" or error code.

Description

This adds a file with the given key name into the form.

Please call CURL.FormFinish after you added all your fields and before you call CURL.Perform.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Add image file to form:

```
MBS("CURL.FormAddKeyFile"; $curl; "Attachment"; "/Users/cs/desktop/Paris.jpg")
```

61.24 CURL.FormAddKeyFileContentType

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormAddKeyFileContentType"; curl; name; Path; ContentType)

Parameters

curl

The CURL session handle.

\$curl

name

The name of the form field.

"city"

Path

Native file path.

"/Users/cs/Desktop/test.txt"

ContentType

The content type for this file.

"text/plain"

Result Returns "OK" or error code.

Description

This adds a file with the given key name into the form.

Please call `CURL.FormFinish` after you added all your fields and before you call `CURL.Perform`.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Add image file to form:

```
MBS("CURL.FormAddKeyFileContentType"; $curl; "Attachment"; "/Users/cs/desktop/Paris.jpg"; "image/jpeg")
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormAddKeyText"; curl; name; filename; text { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

name

The name of the form field.

"city"

filename

The file name for this file.

"test.txt"

text

The text for the text file.

"Hello World"

Encoding

Optional

The text encoding. Default is native.

UTF8

Result Returns "OK" or error code.

Description

This adds simply text file field with a given name and value.

Please call CURL.FormFinish after you added all your fields and before you call CURL.Perform.

Examples

Add a text file to form:

```
MBS("CURL.FormAddKeyText"; $curl; "Attachment"; "test.txt"; "Hello World"; "UTF-8")
```

Result Returns "OK" or error code.

Description

This adds text file form field with a given name and value.

Please call `CURL.FormFinish` after you added all your fields and before you call `CURL.Perform`.

Examples

Add text file:

```
MBS("CURL.FormAddKeyTextContentType"; $curl; "Attachment"; "test.txt"; "Hello World"; "UTF-8"; "text/plain")
```

Add PDF container:

```
Set Variable [ $r; Value: MBS( "CURL.FormAddKeyContainerContentType"; $curl; "file"; "document.pdf"; Test::MyContainer; "application/pdf" ) ]
```

61.26. *CURL.FORMADDKEYTEXTCONTENTTYPE* 1807
Set Variable [\$r; Value: MBS("CURL.FormFinish"; Handle)]

61.27 CURL.FormAddKeyValue

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormAddKeyValue"; curl; Name; Value)

Parameters

curl

The CURL session handle.

\$curl

Name

The name of the form field.

"city"

Value

The value for the form field.

"Nickenich"

Result Returns "OK" or error code.

Description

This adds simply form field with a given name and value.

For text encoding UTF-8 is used here.

Please call CURL.FormFinish after you added all your fields and before you call CURL.Perform.

Examples

Sets city in a form

```
MBS( "CURL.FormAddKeyValue"; $curl; "City"; "Nickenich" )
```

Build form:

```
MBS( "CURL.FormAddKeyValue"; $curl; "login"; "testuser" )
```

```
MBS( "CURL.FormAddKeyValue"; $curl; "password"; "xxx" )
```

```
MBS( "CURL.FormFinish"; $curl )
```

61.28 `CURL.FormAddKeyValueContentType`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormAddKeyValueContentType"; curl; name; value; contenttype)

Parameters

curl

The CURL session handle.

\$curl

name

The name of the form field.

"city"

value

The value for the form field.

"<html></html>"

contenttype

The mime content type for this field.

"text/html"

Result Returns "OK" or error code.

Description

This adds simply form field with a given name and value.

For text encoding UTF-8 is used here.

Please call `CURL.FormFinish` after you added all your fields and before you call `CURL.Perform`.

You can use `Text.FileExtensionToMimeType` to find the content type for a file extension.

Examples

Sets comment field with text file:

```
MBS("CURL.FormAddKeyValueContentType"; $curl; "Comment"; "Hello World"; "text/plain")
```

61.29 CURL.FormClear

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	9.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormClear"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns OK or error.

Description

You usually don't need to call this as CURL.Perform clears form data when transfer is done.

See also

- 61.142 CURL.Perform

1954

- [MBS FileMaker Plugin, version 8.6pr3](#)

Created 12nd December 2018, last changed 12nd December 2018.

61.30 CURL.FormFinish

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.FormFinish"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns "OK" or error code.

Description

The form is assigned to the HTTPPost property.

Examples

Sets form values and finishes:

```
MBS( "CURL.FormAddKeyValue"; $curl; "login"; "testuser" )
MBS( "CURL.FormAddKeyValue"; $curl; "password"; "xxx" )
MBS( "CURL.FormFinish"; $curl )
```

Add PDF container:

```
Set Variable [ $r; Value: MBS( "CURL.FormAddKeyContainerContentType"; $curl; "file"; "document.pdf";
Test::MyContainer; "application/pdf" ) ]
Set Variable [ $r; Value: MBS( "CURL.FormFinish"; $curl ) ]
```

61.31 CURL.GetActiveSocket

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetActiveSocket"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns number or error.

Description

If the socket is no longer valid, -1 is returned. When you finish working with the socket, the `CURL.Cleanup` closes the socket and cleanup other resources associated with the handle. This is typically used in combination with `CURL.SetOptionConnectOnly`.

This option was added as a replacement for `CURL.GetLastSocket` since that one isn't working on all platforms.

See also

- 61.9 `CURL.Cleanup` 1772

Created 15th April 2018, last changed 15th April 2018.

61.32 CURL.GetAppConnectTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetAppConnectTime"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

This time is most often very near to the PRETRANSFER time, except for cases such as HTTP pipelining where the pretransfer time can be delayed due to waits in line for the pipeline and more.

See also

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetBatchCurrentFilePath"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns text or error.

Description

For a batch download with wildcard match, you can query current file path to show in progress dialog.

Only available while downloading a file.

Returns the native path to the destination file.

61.37 **CURL.GetCertInfo**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetCertInfo"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns text or error.

Description

Returns a list of lists with infos.

Examples

Query certificate information for MBS website:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
```

```
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.monkeybreadsoftware.de/") ]
```

```
Set Variable [ $result; Value:MBS("CURL.SetOptionCertInfo"; $curl; 1) ]
```

```
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
```

```
Set Field [ CURL Test::Text; MBS("CURL.GetCertInfo"; $curl) ]
```

```
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.38 **CURL.GetConditionUnmet**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetConditionUnmet"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

see `CURL.SetOptionTimeCondition`. Alas, if this returns a 1 you know that the reason you didn't get data in return is because it didn't fulfill the condition. You get a zero if the condition instead was met.

See also

- 61.364 `CURL.SetOptionTimeCondition` 2281

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetContentLengthUpload"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

Returns -1 if the size isn't known.

See also

- 61.40 CURL.GetContentLengthDownload

1825

Example Databases

- [CURL/CURL Download Picture with Info](#)

Created 18th August 2014, last changed 18th August 2014.

61.42 **CURL.GetContentType**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetContentType"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

This is the value read from the Content-Type: field. If you get an empty string, it means that the server didn't send a valid Content-Type header or that the protocol used doesn't support this.

See also

- 61.39 [CURL.GetConnectTime](#)

61.43 CURL.GetCookieList

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetCookieList"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

If there are no cookies (cookies for the handle have not been enabled or simply none have been received), the list is just an empty string.

Examples

Perform SOAP service with login and use cookies in second request:

```
# The URL of the service
Set Variable [ $url ; Value: "http://somedomain.com/PartnerService17.asmx" ]
# Build XML for SOAP Login request, e.g. with MBS XML functions or simply substitute()
Set Variable [ $xml ; Value: "<?xml version=\"1.0\" encoding=\"utf-8\"?><soap:Envelope xmlns:xsi=\"http://www.w3.org
instance\" xmlns:xsd=\"http://www.w3.org/2001/XMLSchema\" xmlns:soap=\"http://schemas.xmlsoap.org/soap/en-
velope/\"><soap:Body></soap:Body>..." ]
Set Field [ Curl_Test::XML ; $xml ]
# The SOAP action to use
Set Variable [ $action ; Value: "http://somedomain.com/partner/loginWithLicenceUnlockInfo" ]
#
# Setup transfer
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; $url) ]
# Put SOAP action and XML data type in the headers
Set Variable [ $result ; Value: MBS("CURL.SetOptionHTTPHeader"; $curl; "Content-Type: text/xml;
charset=utf-8"; "Expect: "; "SOAPAction: \"\& $action & \"") ]
# Ask CURL to manage cookies
Set Variable [ $result ; Value: MBS("CURL.SetOptionCookieFile"; $curl; "" ) ]
# Set the payload for the login transfer
Set Variable [ $result ; Value: MBS("CURL.SetOptionPostFields"; $curl; $xml) ]
# Run transfer
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
# Let's take a look on the cookie list
Set Variable [ $$cookie ; Value: MBS("CURL.GetCookieList"; $curl ) ]
Set Field [ Curl_Test::Cookie ; $$cookie ]
# Check result
Set Field [ Curl_Test::Debug ; MBS("CURL.GetDebugAsText"; $curl) ]
```

```

Set Variable [ $result ; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Field [ Curl_Test::Resultat ; $result ]
#
# Reuse same $curl for second request reusing existing cookies
#
# Make new XML for second request
Set Variable [ $npk ; Value: "103" ]
# Build XML for SOAP Login request, e.g. with MBS XML functions or simply substitute()
Set Variable [ $xml ; Value: "<soap:Envelope xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\"
xmlns:xsd=\"http://www.w3.org/2001/XMLSchema\" xmlns:soap=\"http://schemas.xmlsoap.org/soap/en-
velope/\"><soap:Body></soap:Body></soap:Envelope>" ]
Set Field [ Curl_Test::XML ; $xml ]
Set Variable [ $action ; Value: "http://somedomain.com/partner/queryInfo" ]
#
# Setup transfer
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; $url) ]
# Put SOAP action and XML data type in the headers
Set Variable [ $result ; Value: MBS("CURL.SetOptionHTTPHeader"; $curl; "Content-Type: text/xml;
charset=utf-8"; "Expect: "; "SOAPAction: \"& $action & \"") ]
# Set the payload for the second transfer
Set Variable [ $result ; Value: MBS("CURL.SetOptionPostFields"; $curl; $xml) ]
# Run transfer
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ Curl_Test::Debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Field [ Curl_Test::Resultat ; $result ]
# Finally end curl session
Set Variable [ $r ; Value: MBS("CURL.Cleanup"; $curl) ]

```

61.44 CURL.GetDebugAsText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetDebugAsText"; curl { ; Encoding; preserveLineEndings })

Parameters**curl**

The CURL session handle.

\$curl

Encoding

Optional

The text encoding for result. Default is native. This function can also handle UTF-16 as well as UTF-16LE and UTF-16BE for little/big endian byte order.

"UTF-8"

preserveLineEndings

Optional

Whether to change line endings to CR for FileMaker. By default (0) we change the line endings to CR, so FileMaker has no trouble. Pass 1 to keep whatever line endings are there.

0

Result The headers as text.

Description

You are responsible for detecting decoding.

Use `CURL.SetOptionVerbose` to enable debug messages.

Plugin version 5.2 and newer replace newlines automatically for you to match what FileMaker uses (Mac line endings).

See `CURL.SetDebugWithData`, `CURL.SetDebugWithProgress` and `CURL.SetDebugWithTime` to include data/time in the debug log.

Examples

Get debug messages:

```
MBS("CURL.GetDebugAsText"; $curl)
```

61.45 CURL.GetDebugLength

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetDebugLength"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Length in bytes.

Description

Examples

Query length. Shows 11 for "Hello World" above:

```
MBS("CURL.GetDebugLength"; $curl)
```

See also

61.46 CURL.GetDebugWithData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetDebugWithData"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns 0, 1 or error.

Description

By default we don't include all the data in the debug log and just the messages.

Returns 1 if data is included or 0 if not.

61.48 CURL.GetDebugWithTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetDebugWithTime"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns 0, 1 or error.

Description

By default this is off.

61.49 CURL.GetEffectiveURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetEffectiveURL"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

Examples

Follow redirection and get effective URL:

```
# Start new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionFollowLocation"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionMaxRedirs"; $curl; 3) ]
# RUN now
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::newURL; MBS("CURL.GetEffectiveURL"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.50 CURL.GetFTPEntryPath

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetFTPEntryPath"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

That is the initial path libcurl ended up in when logging on to the remote FTP server. This stores a NULL as pointer if something is wrong.

Example Databases

- [CURL/CURL Download Picture with Info](#)

Created 18th August 2014, last changed 18th August 2014.

61.51 CURL.GetFileTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetFileTime"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

If you get an empty result, it can be because of many reasons (unknown, the server hides it or the server doesn't support the command that tells document time etc) and the time of the document is unknown. Note that you must tell the server to collect this information before the transfer is made, by using the `CURL.SetOptionFileTime` or you will unconditionally get an empty result back.

61.52 CURL.GetFinishedEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.1	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetFinishedEvaluate"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns text or error.

Description

See also

- 61.53 CURL.GetFinishedFileName 1843

61.53 **CURL.GetFinishedFileName**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetFinishedFileName"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns file name or error.

Description

See also

- 61.52 [CURL.GetFinishedEvaluate](#) 1842
- 61.54 [CURL.GetFinishedScriptName](#) 1844
- 61.156 [CURL.SetFinishedEvaluate](#) 1987

Created 12nd July 2015, last changed 12nd July 2015.

61.54 CURL.GetFinishedScriptName

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetFinishedScriptName"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns script name or error.

Description

See also

- 61.53 CURL.GetFinishedFileName 1843
- 61.157 CURL.SetFinishedScript 1989

Created 12nd July 2015, last changed 12nd July 2015.

61.55 **CURL.GetFormData**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetFormData"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns text or error.

Description

If you use functions like `CURL.FormAddKeyText`, you can check here how things would be sent.

Examples

Build form data:

```

Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "firma"; Test::firma) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "name"; Test::name) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "strasse"; Test::strasse) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "plz"; Test::plz) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "ort"; Test::ort) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "land"; Test::land) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "telefon"; Test::telefon) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "email"; Test::email) ]
Set Variable [ $result ; Value: MBS("CURL.FormAddKeyValue"; $curl; "comment"; Test::comment) ]
Set Variable [ $result ; Value: MBS("CURL.FormFinish"; $curl) ]
Set Field [ Test::DebugMessages ; MBS("CURL.GetFormData"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

61.56 CURL.GetHTTPAuthAvail

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetHTTPAuthAvail"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

The meaning of the bits is explained in `CURL.SetOptionHTTPAuth`.

See also

Created 18th August 2014, last changed 18th August 2014.

61.58 **CURL.GetHTTPVersion**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetHTTPVersion"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns number or error.

Description

Created 15th April 2018, last changed 16th April 2018.

61.59 `CURL.GetHeaderAsText`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.GetHeaderAsText"; curl { ; Encoding; preserveLineEndings } )
```

Parameters

curl

The CURL session handle.

\$curl

Encoding

Optional

The text encoding for result. Default is native. This function can also handle UTF-16 as well as UTF-16LE and UTF-16BE for little/big endian byte order.

"UTF-8"

preserveLineEndings

Optional

Whether to change line endings to CR for FileMaker. By default (0) we change the line endings to CR, so FileMaker has no trouble. Pass 1 to keep whatever line endings are there.

0

Result The headers as text.

Description

You are responsible for detecting decoding.

Plugin version 5.2 and newer replace newlines automatically for you to match what FileMaker uses (Mac line endings).

Examples

Get header lines:

```
MBS("CURL.GetHeaderAsText"; $curl)
```

Get file name for container from header:

```
Set Variable [ $name ; Value: "" ]
```

```
Set Variable [ $headers ; Value: MBS( "CURL.GetHeaderAsText"; $curl; "UTF-8" ) ]
```

```
Set Variable [ $headers ; Value: MBS( "List.MatchesPrefix"; $headers; "Content-Disposition: attachment; filename=" ) ]
```

```
If [ Length($headers) >0 ]
```

```
Set Variable [ $name ; Value: Middle ( $headers ; 43 ; Length($headers) ) ]
```

```
End If
```

```
Set Field [ CURL Test::File ; MBS("CURL.GetResultAsContainer"; $curl; $name) ]
```

61.60 CURL.GetHeaderLength

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetHeaderLength"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Length in bytes.

Description

Examples

Query length. Shows 11 for "Hello World" above:

```
MBS("CURL.GetHeaderLength"; $curl)
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.8	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetInputAsText"; curl { ; Encoding; preserveLineEndings })

Parameters

curl

The CURL session handle.

\$curl

Encoding

Optional

The text encoding for result. Default is native. This function can also handle UTF-16 as well as UTF-16LE and UTF-16BE for little/big endian byte order.

"UTF-8"

preserveLineEndings

Optional

Whether to change line endings to CR for FileMaker. By default (0) we change the line endings to CR, so FileMaker has no trouble. Pass 1 to keep whatever line endings are there.

0

Result The input data as text.

Description

You are responsible for detecting decoding.

Plugin version 5.2 and newer replace newlines automatically for you to match what FileMaker uses (Mac line endings).

61.80 **CURL.GetOptionHTTP200Aliases**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetOptionHTTP200Aliases"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns list or error.

Description

See also

- 61.227 [CURL.SetOptionHTTP200Aliases](#)

2094

Created 16th April 2018, last changed 16th April 2018.

61.81 CURL.GetOptionHTTPHeader

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetOptionHTTPHeader"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns list or error.

Description

Examples

Set and get headers:

```
Set Variable [ $curl ; Value: MBS("CURL.New") ]
```

```
Set Variable [ $r ; Value: MBS( "CURL.SetOptionHTTPHeader"; $curl; "Content-Type: application/json$Test: hello"; "Other: 1234" ) ]
```

```
Show Custom Dialog [ "Headers" ; MBS( "CURL.GetOptionHTTPHeader"; $curl ) ]
```

61.89 CURL.GetPreTransferTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetPreTransferTime"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

This includes all pre-transfer commands and negotiations that are specific to the particular protocol(s) involved. It does not involve the sending of the protocol- specific request that triggers a transfer.

61.92 CURL.GetProgressCurrentDownload

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetProgressCurrentDownload"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result The number of bytes already downloaded.

Description

Only useful with CURL.PerformInBackground.

Examples

Calculate percent uploaded

```
$percent = 100 * MBS( "CURL.GetProgressCurrentDownload"; $curl ) / MBS( "CURL.GetProgressTotal-Download"; $curl )
```

See also

61.93 CURL.GetProgressCurrentUpload

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetProgressCurrentUpload"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result The number of bytes already uploaded.

Description

Only useful with CURL.PerformInBackground.

Examples

Calculate percent uploaded

```
$percent = 100 * MBS( "CURL.GetProgressCurrentUpload"; $curl ) / MBS( "CURL.GetProgressTotalUpload"; $curl )
```

See also

61.96 CURL.GetProgressPercent

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetProgressPercent"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns number or error.

Description

This is percent of upload/download of current transfer.

Range is 0 to 100.

Examples

Update progress field in a progress script:

```
Set Variable [ $curl; Value:Get(ScriptParameter) ]
```

```
Set Variable [ $RecordID; Value:MBS("CURL.GetTag"; $curl) ]
```

```
Go to Record/Request/Page [ No dialog; $RecordID ]
```

```
Set Field [ Download Async::Progress; MBS("CURL.GetProgressPercent"; $curl) ]
```

```
Commit Records/Requests [ Skip data entry validation; No dialog ]
```

Created 18th August 2014, last changed 18th August 2014.

61.109 CURL.GetRedirectURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetRedirectURL"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

This can come very handy if you think using the built-in libcurl redirect logic isn't good enough for you but you would still prefer to avoid implementing all the magic of figuring out the new URL.

Examples

Do not follow, but return redirect URL:

```
# Start new session
Set Variable [ $curl ; Value: MBS("CURL.New") ]
# Set URL to load
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
# RUN now
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text ; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::newURL ; MBS("CURL.GetRedirectURL"; $curl) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]
```

61.110 CURL.GetRequestSize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetRequestSize"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

This is so far only for HTTP requests. Note that this may be more than one request if `CURL.SetOption-FollowLocation` is true.

See also

- 61.61 `CURL.GetHeaderSize` 1853
- 61.221 `CURL.SetOptionFollowLocation` 2086

61.111 CURL.GetResponseCode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResponseCode"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

This will be zero if no server response code has been received. Note that a proxy's CONNECT response should be read with `CURL.GetHTTPConnectCode` and not this.

For HTTP this is the normal status code. e.g. 200 for OK and 404 for file not found.

Examples

On success puts download in container, else shows failed:

```
Set Variable [ $errorCode; Value:MBS("CURL.ErrorCode"; $curl) ]
Set Variable [ $httpResult; Value:MBS("CURL.GetResponseCode"; $curl) ]
Set Field [ Download Async::Result; $errorCode ]
Set Field [ Download Async::DebugMessages; MBS("CURL.GetDebugAsText"; $curl) ]
If [ $errorCode = 0 and $httpResult = 200 ]
Set Field [ Download Async::Progress; "Done" ]
Set Field [ Download Async::Output; MBS("CURL.GetResultAsContainer"; $curl) ]
Else
Set Field [ Download Async::Progress; "Failed" ]
Set Field [ Download Async::Output; "" ]
End If
```

61.112 CURL.GetResultAsContainer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsContainer"; curl { ; Filename; PluginDetect })

Parameters**curl**

The CURL session handle.

\$curl

Filename

Optional

The desired file name

test.jpg

PluginDetect

Optional

If 1 the plugin will do the file type detection. If not provided or 0 and the FileMaker version is 13.0 or newer, the FileMaker engine will decide on the type.

Result Returns OK or error.

Description

The plugin will detect the type of data based on the file extension.

If no filename is provided, the plugin uses the filename from the URL.

For PDF content: If you have a DynaPDF Pro license and DynaPDF functions initialized, this function can add previews for the PDF file on Windows and Linux. For MacOS, we make them with PDFKit.

Examples

Load JPEG from URL to container:

```
# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://monkeybreadsoftware.com/filemaker/images/devcon2013.jpg") ]
# run transfer
Set Variable [ $ErrorCode; Value:MBS("CURL.Perform"; $curl) ]
# get result as JPG and store in field:
Set Variable [ $Result; Value:MBS( "CURL.GetResultAsContainer"; $curl) ]
Set Field [ test::MyContainerField; $Result ]
# get debug messages:
Set Variable [ $DebugMessages; Value:MBS( "CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]
```

Download picture and scale it down:

```

Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionURL"; $curl; MIX::URL) ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionFollowLocation"; $curl; 1) ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionMaxRedirs"; $curl; 3) ]
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
Set Variable [ $debug ; Value: MBS("CURL.GetDebugAsText"; $curl) ]
If [ $result = "OK" ]
Set Variable [ $Image ; Value: MBS("CURL.GetResultAsContainer"; $curl) ]
Set Variable [ $ImageRef ; Value: MBS("GImage.NewFromContainer"; $image) ]
If [ MBS("IsError") = 0 ]
Set Variable [ $r ; Value: MBS("GImage.Scale";$ImageRef; "256x256>") ]
Set Variable [ $ScaledImage ; Value: MBS("GImage.WriteToJPEGContainer"; $ImageRef) ]
If [ MBS("IsError") = 0 ]
Set Field [ MIX::Image ; $ScaledImage ]
End If
Set Variable [ $r ; Value: MBS("GImage.Release";$ImageRef) ]
End If
End If
Set Variable [ $r ; Value: MBS("CURL.Cleanup"; $curl) ]

```

Get file name for container from header:

```

Set Variable [ $name ; Value: "" ]
Set Variable [ $headers ; Value: MBS("CURL.GetHeaderAsText"; $curl; "UTF-8") ]
Set Variable [ $headers ; Value: MBS("List.MatchesPrefix"; $headers; "Content-Disposition: attachment; filename=") ]
If [ Length($headers) >0 ]
Set Variable [ $name ; Value: Middle ( $headers ; 43 ; Length($headers) ) ]
End If
Set Field [ CURL Test::File ; MBS("CURL.GetResultAsContainer"; $curl; $name) ]

```

61.113 `CURL.GetResultAsData`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsData"; curl; Type { ; Filename })

Parameters

curl

The CURL session handle.

\$curl

Type

The type the new data should have for FileMaker. See container functions. Typically "PDF " for pdf files, "FILE" for normal binary files and special codes for pictures like "JPEG".

"FILE"

Filename

Optional

The desired file name

test.zip

Result A container value or empty on error.

Description

Make sure the data is in the format you tell FileMaker. FileMaker uses internally 4 letter codes to know what data is stored in containers and you need to pass a suitable type code.

Please note that types are always 4 characters long, "PDF " has a space on the end.

Version 5.2 and later can use the filename from URL if you don't provide one yourself.

61.114 `CURL.GetResultAsEMailList`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	9.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsEMailList"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns JSON or error.

Description

Returns result as JSON with details for emails.

Examples

Query email list as JSON:

```
Go to Layout [ "IMAP Postbox" (IMAP Postbox) ; Animation: None ]
# get URL
Set Variable [ $URL ; Value: "imap://imap.monkeybreadsoftware.de/INBOX" ]
# query list of emails
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionURL"; $curl; $URL) ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionUserName"; $curl; IMAP Postbox::Username) ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionPassword"; $curl; IMAP Postbox::Password) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUseSSL"; $curl; 3) // required ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionSSLVersion"; $curl; 6) // TLS v1.2 ]
# Set query for all emails by UID. Not all fields are needed. Only request those you need to make it quicker.
Set Variable [ $r ; Value: MBS("CURL.SetOptionCustomRequest"; $curl; "UID FETCH 1:* (FLAGS INTERNALDATE RFC822.SIZE BODY.PEEK [ HEADER.FIELDS (Message-Id DATE FROM SUBJECT TO SENDER REPLY-TO CC BCC) ] )" ) ]
# Run transfer
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
# We show results for debugging
Set Variable [ $output ; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Variable [ $debug ; Value: MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $list ; Value: MBS( "JSON.Colorize";MBS("CURL.GetResultAsEMailList"; $curl)) ]
Set Variable [ $r ; Value: MBS("CURL.Cleanup"; $curl) ]
Set Field [ IMAP Postbox::Log ; $debug ]
Set Field [ IMAP Postbox::JSON ; $list ]
```

61.115 `CURL.GetResultAsEmail`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.3	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsEmail"; curl)

Parameters

`curl`

The CURL session handle.

`$curl`

Result Returns email parser reference number or error.

Description

If the content is a valid email content, the email is parsed and you get back the reference number. Please use `EmailParser.Free` to free it later and release memory.

61.116 CURL.GetResultAsGIF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	3.1	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsGIF"; curl { ; Filename })

Parameters**curl**

The CURL session handle.

\$curl

Filename

Optional

The desired file name.

test.gif

Result The result value which you can assign to a container field.

Description

Make sure the data is a GIF. The plugin does not verify whether result is a GIF file. But if it is one, it sets size properties so FileMaker can preview it.

Version 5.2 and later can use the filename from URL if you don't provide one yourself.

See also `CURL.GetResultAsContainer`.

Examples

Load GIF image from URL:

```
# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://monkeybreadsoftware.com/filemaker/images/dynapdf.gif") ]
# run transfer
Set Variable [ $ErrorCode; Value:MBS("CURL.Perform"; $curl) ]
# get result as GIF and store in field:
Set Variable [ $Result; Value:MBS( "CURL.GetResultAsGIF"; $curl) ]
Set Field [ test::MyContainerField; $Result ]
# get debug messages:
Set Variable [ $DebugMessages; Value:MBS( "CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.118 CURL.GetResultAsMime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	10.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsMime"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns email parser reference number or error.

Description

If you got an answer from a web service with multi part mime output, this function will parse it with our mime parser (normally used for emails) and then return you the object reference.

Please use EmailParser.Free to free it later and release memory.

Examples

Get image objects:

```
Set Variable [ $email ; Value: MBS("CURL.GetResultAsMime"; $curl) ]
Set Field [ test::Part1 ; MBS( "EmailParser.Inline"; $email; 0; "container") ]
Set Field [ test::Image ; MBS( "EmailParser.Inline"; $email; 1; "container") ]
Set Variable [ $email ; Value: MBS("EmailParser.Free"; $email) ]
```

- [MBS FileMaker Plugin, version 9.6pr3](#)

Created 12nd December 2019, last changed 12nd December 2019.

61.119 CURL.GetResultAsPDF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	4.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultAsPDF"; curl { ; Filename; DontRenderPreview })

Parameters**curl**

The CURL session handle.

\$curl

Filename

Optional

The desired file name.

test.png

DontRenderPreview

Optional

Pass 1 to not create a JPEG with preview of first page as part of the container.

0

Result The result value which you can assign to a container field.

Description

Make sure the data is a PDF. The plugin does not verify whether result is a PDF file. But if it is one, it sets size properties and creates a preview JPEG so FileMaker can preview it (Preview is Mac only).

For Windows you can generate preview with DynaPDF.GeneratePreview function.

Version 5.2 and later can use the filename from URL if you don't provide one yourself.

See also `CURL.GetResultAsContainer`

If you have a DynaPDF Pro license and DynaPDF functions initialized, this function can add previews for the PDF file on Windows and Linux. For MacOS, we make them with PDFKit..

Examples

Load PDF from URL and store in container:

```
# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.monkeybreadsoftware.com/file-maker/files/Installation.pdf") ]
# run transfer
Set Variable [ $ErrorCode; Value:MBS("CURL.Perform"; $curl) ]
# get result as PDF and store in field:
Set Variable [ $Result; Value:MBS( "CURL.GetResultAsPDF"; $curl) ]
Set Field [ test::MyContainerField; $Result ]
```

61.119. *CURL.GETRESULTASPDF* 1923

get debug messages:

```
Set Variable [ $DebugMessages; Value:MBS( "CURL.GetDebugAsText"; $curl) ]
```

cleanup

```
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.120 `CURL.GetResultAsPNG`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.GetResultAsPNG"; curl { ; Filename } )
```

Parameters

curl

The CURL session handle.

`$curl`

Filename

Optional

The desired file name.

`test.png`

Result The result value which you can assign to a container field.

Description

Make sure the data is a PNG. The plugin does not verify whether result is a PNG file. But if it is one, it sets size properties and creates a preview JPEG so FileMaker can preview it.

Version 5.2 and later can use the filename from URL if you don't provide one yourself.

See also `CURL.GetResultAsContainer`.

Examples

Load a PNG file from URL into container:

```
# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.monkeybreadsoftware.com/file-maker/images/devcon_14_banner_horz.png") ]

Created 18th August 2014, last changed 29th November 2019.

61.121 CURL.GetResultAsText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.GetResultAsText"; curl { ; Encoding; preserveLineEndings } )
```

Parameters**curl**

The CURL session handle.

\$curl

Encoding

Optional

The text encoding for result. Default is native. This function can also handle UTF-16 as well as UTF-16LE and UTF-16BE for little/big endian byte order.

"UTF-8"

preserveLineEndings

Optional

Whether to change line endings to CR for FileMaker. By default (0) we change the line endings to CR, so FileMaker has no trouble. Pass 1 to keep whatever line endings are there.

0

Result The result as text.

Description

You are responsible for detecting decoding.

See also `CURL.GetResultAsContainer`.

Plugin version 5.2 and newer replace newlines automatically for you to match what FileMaker uses (Mac line endings).

Examples

Query result as UTF-8 text:

```
MBS("CURL.GetResultAsText"; $curl; "UTF-8")
```

Query result as Windows Ansi encoding:

```
MBS("CURL.GetResultAsText"; $curl; "windows")
```

Get result text and convert line endings for FileMaker:

```
MBS("Text.ReplaceNewline"; MBS("CURL.GetResultAsText"; $curl);1)
```

Download some text:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Download a text from URL:

```
# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.mbsplugins.eu/") ]
# run transfer
Set Variable [ $ErrorCode; Value:MBS("CURL.Perform"; $curl) ]
# get result as text and debug messages:
Set Variable [ $TextResult; Value:MBS("CURL.GetResultAsText"; $curl) ]
Set Variable [ $DebugMessages; Value:MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]
```

Query webservice with JSON request:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "http://test.test/ws/v1/catalogo/get-modelos") ]
# pass JSON for query
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; " { \"brandId\" : \"1\", \"device\" : \"70\" } "; "UTF-8") ]
Set Field [ models::result; MBS("CURL.Perform"; $curl) ]
Set Field [ models::text; MBS("CURL.GetResultAsText"; $curl;"UTF8") ]
Set Field [ models::header; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.122 CURL.GetResultLength

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetResultLength"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Length in bytes.

Description

Examples

Query length. Shows 11 for "Hello World" above:

MBS("CURL.GetResultLength"; \$curl)

See also

- 61.45 CURL.GetDebugLength 1834
- 61.60 CURL.GetHeaderLength 1852
- 61.63 CURL.GetInputLength 1856

Created 18th August 2014, last changed 18th August 2014.

61.123 **CURL.GetSSLEngines**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetSSLEngines"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

Note that engines are normally implemented in separate dynamic libraries. Hence not all the returned engines may be available at run-time.

Example Databases

- [CURL/CURL Download Picture with Info](#)

Created 18th August 2014, last changed 18th August 2014.

61.124 CURL.GetSSLVerifyResult

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetSSLVerifyResult"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

If enabled with CURL.SetOptionVerifyPeer.

See also

- 61.102 CURL.GetProxySSLVerifyResult 1895

Example Databases

Created 18th August 2014, last changed 18th August 2014.

61.125 **CURL.GetScheme**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetScheme"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns text or error.

Description

Created 15th April 2018, last changed 16th April 2018.

61.126 CURL.GetSizeDownload

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetSizeDownload"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns the requested value or nothing on error.

Description

The amount is only for the latest transfer and will be reset again for each new transfer.

See also

61.130 `CURL.GetStartTransferTime`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetStartTransferTime"; curl)

Parameters

`curl`

The CURL session handle.

`$curl`

Result Returns the requested value or nothing on error.

Description

This includes `CURL.GetPreTransferTime` and also the time the server needs to calculate the result.

See also

- 61.89 `CURL.GetPreTransferTime` 1882

Example Databases

61.131 CURL.GetTag

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetTag"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns text or error.

Description**Examples**

Query record ID from tag in script:

```
Set Variable [ $curl; Value:Get(ScriptParameter) ]
Set Variable [ $RecordID; Value:MBS("CURL.GetTag"; $curl) ]
```

Test tag:

```
Set Variable [ $curl; Value:MBS( "CURL.New" ) ]
# Set Tag to some value
Set Variable [ $r; Value:MBS( "CURL.SetTag"; $curl; "Hello World" ) ]
# Later read back the value
Set Variable [ $tag; Value:MBS( "CURL.GetTag"; $curl) ]
```

61.132 `CURL.GetTotalTime`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.GetTotalTime"; curl)

Parameters

`curl`

The CURL session handle.

`$curl`

Result Returns the requested value or nothing on error.

Description

Example Databases

- [CURL/CURL Download Picture with Info](#)

Created 18th August 2014, last changed 18th August 2014.

61.133 **CURL.Host**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Host")

Result The host string.

Description

This is an ascii string showing what host information that this curl was built for.

Examples

Shows host:

Show Custom Dialog ["Transfer error"; MBS("CURL.Host")]

See also

61.134 CURL.IsRunning

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.IsRunning"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Returns 1 if transfer is running or 0 if not.

Description

This is useful if you started transfer with `CURL.PerformInBackground` and you want to know whether it has finished yet or not.

When perform is done in background, use `CURL.ErrorCode` and `CURL.ErrorMessage` to query result status.

61.138 CURL.List

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.4	Yes	Yes	Yes	Yes	Yes

MBS("CURL.List")

Result Returns list or error.

Description

Returns IDs for all CURL objects in memory. If this list is growing, you may have forgotten to call `CURL.cleanup` in your scripts.

Normally after all scripts are done, this list should be empty unless there is an asynchron or background transfer still running.

See also

- [61.9 CURL.Cleanup](#) 1772

61.139 CURL.New

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.New" )
```

Result A new CURL handle.

Description

This function must be the first function to call, and it returns a CURL handle that you must use as input to other CURL functions. `CURL.New` initializes curl and this call **MUST** have a corresponding call to `CURL.Cleanup` when the operation is complete. You can use one curl object for multiple transfers reusing same connection.

Result is a number greater than zero on success. Errors returned may be about low memory or too many CURL connections.

CURL reference numbers are starting at 16000 and counting up for each new session.

Examples

Initialize a CURL session and set URL:

```
$curl = MBS( "CURL.New" )
$r = MBS("CURL.SetOptionURL"; $curl; $URL)
```

Query a REST API:

```
# new session
Set Variable [ $curl; MBS( "CURL.New" ) ]
# set URL for this REST API
Set Variable [ $r; MBS("CURL.SetOptionURL"; $curl; "https://example.test/wc-api/v2/products" ) ]
# make a post with some data
Set Variable [ $r; MBS("CURL.SetOptionPost"; $curl; 1 ) ]
Set Variable [ $r; MBS("CURL.SetOptionPostFields"; $curl; " { product: { ... } } "; "UTF-8" ) ]
# set credentials
Set Variable [ $r; MBS("CURL.SetOptionUsername"; $curl; "consumer_key" ) ]
Set Variable [ $r; MBS("CURL.SetOptionPassword"; $curl; "consumer_secret" ) ]
# add header option
Set Variable [ $r; MBS("CURL.SetOptionHTTPHeader"; $curl; "Content-Type: application/json", "Expect:" ) ]
# disable security for this demo:
Set Variable [ $r; MBS( "CURL.SetOptionSSLVerifyHost"; $curl; 0 ) ]
Set Variable [ $r; MBS( "CURL.SetOptionSSLVerifyPeer"; $curl; 0 ) ]
# with log messages
Set Variable [ $r; MBS( "CURL.SetOptionVerbose"; $curl; 1 ) ]
# run it!
Set Variable [ $Error; MBS( "CURL.Perform"; $curl ) ]
# check debug messages
```

```

Set Variable [ $Messages; MBS("CURL.GetDebugAsText"; $curl) ]
# check result
Set Variable [ $Output; MBS("CURL.GetResultAsText"; $curl) ]
# and cleanup
Set Variable [ $r; MBS( "CURL.Cleanup"; $curl ) ]

```

Download a text from URL:

```

# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.mbsplugins.eu/") ]
# run transfer
Set Variable [ $ErrorCode; Value:MBS("CURL.Perform"; $curl) ]
# get result as text and debug messages:
Set Variable [ $TextResult; Value:MBS( "CURL.GetResultAsText"; $curl) ]
Set Variable [ $DebugMessages; Value:MBS( "CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]

```

61.140 CURL.NumberOfRunningTransfers

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.NumberOfRunningTransfers")

Result Returns number or error.

Description

Use CURL.RunningTransfers to get list of CURL handles for running transfers.

See also

- 61.75 CURL.GetMultiRunningTransfers 1868
- 61.149 CURL.RunningTransfers 1974

Created 12nd July 2015, last changed 12nd July 2015.

61.141 CURL.OpenInputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.OpenInputFile"; curl; Path { ; Offset; Length })

Parameters**curl**

The CURL session handle.

\$curl

Path

Native file path.

"C:\Documents\Test.Txt"

Offset

Optional

Available in MBS FileMaker Plugin 8.4 or newer.

Offset where to start reading relative to file start.

1024*1024

Length

Optional

Available in MBS FileMaker Plugin 8.4 or newer.

Size of data to read from file.

1024*1024*10

Result Returns "OK" on success or error message.

Description

If you set input file, the data from CURL.SetInput* functions is ignored.

Do not call this method while a transfer is running.

If you have data in container, please check CURL.SetInputFile.

You may need to use CURL.SetOptionUpload to make it an upload for FTP/SFTP.

If you specify offset and length, we only read that part of the file in memory.

Otherwise we stream from the file on request.

This function requires a native path. Use Path.FileMakerPathToNativePath to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use FileDialog functions.

For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Set input from file on disk:

```
Set Variable [ $result ; Value: MBS( "CURL.OpenInputFile"; $curl; "/Users/cs/Desktop/test.zip" ) ]
```

Upload file via FTP:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]

# FTP URL with destination file name:
Set Variable [ $result; Value: MBS("CURL.SetOptionURL" ; $curl ; "ftp://12.34.56.78/AZ1677ZZ.jpg") ]
Set Variable [ $result; Value: MBS("CURL.SetOptionUpload" ; $curl ; 1) ]
Set Variable [ $result; Value: MBS("CURL.SetOptionPassword" ; $curl ; "xxx" ) ]
Set Variable [ $result; Value: MBS("CURL.SetOptionUsername" ; $curl ; "yyy" ) ]

# Pick file from desktop:
Set Variable [ $Desktop; Value: MBS("Folders.UserDesktop") ]
Set Variable [ $Path; Value: MBS("Path.AddPathComponent"; $desktop; "AZ1677ZZ.jpg") ]
Set Variable [ $result; Value: MBS( "CURL.OpenInputFile" ; $curl ;$path ) ]

# Pick file from container:
// Set Variable [ $result; Value: MBS( "CURL.SetInputFile" ; $curl ; Test::ImageFileContainer ) ]

# Upload file
Set Field [ Test::PerformResult; MBS( "CURL.Perform" ; $curl ) ]
Set Field [ Test::DebugMessages; MBS( "CURL.GetDebugAsText" ; $curl ) ]
Set Variable [ $result; Value:MBS( "CURL.Cleanup" ; $curl ) ]
```

61.142 CURL.Perform

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Perform"; curl)

Parameters

curl

The CURL session handle.

\$curl

Result Error code. 0 means everything was ok, non-zero means an error occurred. The number may be followed by a text description.

Description

This function is called after the init and all the options are set, and will perform the transfer as described in the options. It must be called with the same handle as input as the CURL.New call returned.

You can do any amount of calls to CURL.Perform while using the same handle. If you intend to transfer more than one file, you are even encouraged to do so. CURL will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use the option functions between the invokes to set options for the following CURL.Perform.

You must never call this function simultaneously from two places using the same handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several curl handles.

While transfer is running, your FileMaker application is blocked. It's useful to show progress with using CURL.SetUpdateProgressDialog. Or you use CURL.PerformInBackground or CURL.PerformAsync to run the transfer in background.

Internal buffer for output, debug and header data is cleared before the perform.

This function returns error codes. If you get an error, please use CURL.GetDebugAsText to read the transcription of the transfer and look for error messages from server.

Typical error codes are 6 for a wrong domain name in the URL, 67 for wrong name/password combination, 60 for missing/bad SSL settings, 1 for an unsupported protocol.

In case of error 60, please decide what SSL policy you want and use our SSL options. e.g. use CURL.SetOptionSSLVerifyHost and CURL.SetOptionSSLVerifyPeer to disable SSL security or use CURL.SetOptionCAInfo to point CURL to a certificate.

No error means the data transfer was okay, but it doesn't tell you if for example a webserver reported an error. Please check `CURL.GetResponseCode` for HTTP requests to get the HTTP status code. e.g. 404 if file is not found.

The list of possible error codes:

With SFTP, you can get logged error "Upload failed: Operation failed (4/-31)" when upload uses path to folder instead of file in URL.

Examples

Query a REST API:

```
# new session
Set Variable [ $curl; MBS( "CURL.New" ) ] ]
# set URL for this REST API
Set Variable [ $r; MBS("CURL.SetOptionURL"; $curl; "https://example.test/wc-api/v2/products") ]
# make a post with some data
Set Variable [ $r; MBS("CURL.SetOptionPost"; $curl; 1) ]
Set Variable [ $r; MBS("CURL.SetOptionPostFields"; $curl; " { product: { ... } } "; "UTF-8") ]
# set credentials
Set Variable [ $r; MBS("CURL.SetOptionUsername"; $curl; "consumer_key") ]
Set Variable [ $r; MBS("CURL.SetOptionPassword"; $curl; "consumer_secret") ]
# add header option
Set Variable [ $r; MBS("CURL.SetOptionHTTPHeader"; $curl; "Content-Type: application/json"; "Expect:" ) ]
# disable security for this demo:
Set Variable [ $r; MBS("CURL.SetOptionSSLVerifyHost"; $curl; 0 ) ]
Set Variable [ $r; MBS("CURL.SetOptionSSLVerifyPeer"; $curl; 0 ) ]
# with log messages
Set Variable [ $r; MBS("CURL.SetOptionVerbose"; $curl; 1 ) ]
# run it!
Set Variable [ $Error; MBS( "CURL.Perform"; $curl ) ]
# check debug messages
Set Variable [ $Messages; MBS("CURL.GetDebugAsText"; $curl) ]
# check result
Set Variable [ $Output; MBS("CURL.GetResultAsText"; $curl) ]
# and cleanup
Set Variable [ $r; MBS( "CURL.Cleanup"; $curl ) ]
```

Using Rosette web service:

```
# Start new CURL transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set options like Verbose Debug Messages
Set Variable [ $result; Value:MBS("CURL.SetOptionVerbose"; $curl; 1) ]
# the url of webservice
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://api.rosette.com/rest/v1/mor-
```

```

phology/parts-of-speech") ]
# the header info for tagging, API Key comes from a global field.
Set Variable [ $result; Value:MBS("CURL.SetOptionHTTPHeader"; $curl; "user_key: " & RosetteAPISettings::RosetteAPIKey; "Content-Type: application/json"; "Accept: application/json" ) ]
# We want a POST transfer:
Set Variable [ $result; Value:MBS("CURL.SetOptionPost"; $curl; 1 ) ]
# Build JSON using the plugin function to properly encode a string:
Set Variable [ $request; Value:" { \"content\": " & MBS("JSON.CreateString"; TextData::TextAsInput) & " } " ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; $request) ]
# show our JSON in a field for debugging:
Set Field [ TextData::CURLInput; $request ]
# Run transfer
Set Variable [ $result; Value:MBS("CURL.Perform"; $curl) ]
# Check result and debug messages
Set Field [ TextData::CurlDebug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Field [ TextData::CurlOutput; MBS("CURL.GetResultAsText"; $curl) ]
# Cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]

```

Download a text from URL:

```

# start new transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set URL
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.mbsplugins.eu/") ]
# run transfer
Set Variable [ $ErrorCode; Value:MBS("CURL.Perform"; $curl) ]
# get result as text and debug messages:
Set Variable [ $TextResult; Value:MBS("CURL.GetResultAsText"; $curl) ]
Set Variable [ $DebugMessages; Value:MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]

```

Charge with Stripe webservice:

```

# new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# use stripe charge API
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://api.stripe.com/v1/charges") ]
# set user name
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "sk_test_ your id here") ]
# make a post with given content:
Set Variable [ $result; Value:MBS("CURL.SetOptionPost"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; "amount=400& currency=usd& description=Charge% 20for% 20test@example.com& source [ object ] =card& source [ number ] =4242424242424242& source [ exp_month ] =12& source [ exp_year ] =2017& source [ cvc ] =123") ]

```

```

# perform
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# now check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Download URL to temp file:

```

Set Variable [ $curl; Value:MBS("CURL.New") ]
# this is URL to download
Set Variable [ $url; Value:"https://www.monkeybreadsoftware.com/filemaker/test.txt" ]
# get file name from URL
Set Variable [ $name; Value:MBS( "Path.LastPathComponent"; $URL ) ]
# now make temp file path
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; MBS( "Folders.SystemTemporary" ); $name
) ]
# set URL to download
Set Variable [ $r; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.monkeybreadsoftware.com/file-
maker/test.txt") ]
# open destination file
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
# run transfer
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# close destination file
Set Variable [ $r; Value:MBS("CURL.CloseOutputFile"; $curl) ]
# get debug messages
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Query IP via ipinfo.io:

```

Go to Layout [ "Table" ]
New Record/Request
# Start new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "http://ipinfo.io") ]
# RUN now
Set Variable [ $result; Value:MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ Table::DebugLog; MBS("CURL.GetDebugAsText"; $curl) ]
Set Field [ Table::Result; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
If [ $result = "OK" ]
# Check HTTP error code
Set Variable [ $response; Value:MBS("CURL.GetResponseCode"; $curl) ]

```

```

If [ $response = 200 ]
# Query values from JSON

# use TLS v1.2
Set Variable [ $result; Value:MBS("CURL.SetOptionSSLVersion"; $curl; 6) ]
# RUN now
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Upload file from OS X to IBM Mainframe:

```

Set Variable [ $debug; Value:"" ]
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "xxx") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; "yyy") ]
Set Variable [ $result; Value:MBS("CURL.OpenInputFile"; $curl; "/Users/gene/Desktop/MY.Logfile.txt") ]
]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "ftp://192.168.1.4:21/MY.LOGFILE1" ) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionVerbose"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionTransferText"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionSSLVerifyPeer"; $curl; 0) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionSSLVerifyHost"; $curl; 0) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionQuote"; $curl; "site RECFM=FB LRECL=1024") ]
Set Variable [ $result; Value:MBS("CURL.Perform"; $curl) ]
Set Variable [ $debug; Value:MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Run a generic POST request for REST or SOAP web service:

```
# new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# use stripe charge API
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://someURL/service") ]
# set user name and password if needed:
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "user name") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; "password") ]
# set some additional headers, which may include custom authorization and content types:
Set Variable [ $result; Value:MBS("CURL.SetOptionHTTPHeader"; $curl; "Authorization: Bearer a92eabb9-76f9-42ee-b280-bcd15cb2e9db"; "Content-Type: application/json" ) ]
# make a post with given content:
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; $json ) ]
# perform
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# now check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Name	Number	Description
CURLE_OK	0	No error.
CURLE_UNSUPPORTED_PROTOCOL	1	Unsupported protocol.
CURLE_FAILED_INIT	2	Initialization failed or option not available.
CURLE_URL_MALFORMAT	3	URL has wrong format.
CURLE_COULDNT_RESOLVE_PROXY	5	DNS didn't return proxy IP.
CURLE_COULDNT_RESOLVE_HOST	6	DNS didn't return IP for host.
CURLE_COULDNT_CONNECT	7	Connection failed.
CURLE_FTP_WEIRD_SERVER_REPLY	8	FTP error.
CURLE_REMOTE_ACCESS_DENIED	9	A service was denied by the server due to lack of access when login fails this is not returned.
CURLE_FTP_WEIRD_PASS_REPLY	11	FTP error.
CURLE_FTP_WEIRD_PASV_REPLY	13	FTP error.
CURLE_FTP_WEIRD_227_FORMAT	14	FTP error.
CURLE_FTP_CANT_GET_HOST	15	FTP error.
CURLE_FTP_COULDNT_SET_TYPE	17	FTP set command failed.
CURLE_PARTIAL_FILE	18	Only a part of the file was downloaded.
CURLE_FTP_COULDNT_RETR_FILE	19	File not found.
CURLE_QUOTE_ERROR	21	quote command failure
CURLE_HTTP_RETURNED_ERROR	22	HTTP returned an error.
CURLE_WRITE_ERROR	23	Write error.
CURLE_UPLOAD_FAILED	25	failed upload "command"
CURLE_READ_ERROR	26	couldn't open/read from file
CURLE_OUT_OF_MEMORY	27	Out Of memory
CURLE_OPERATION_TIMEDOUT	28	the timeout time was reached
CURLE_FTP_PORT_FAILED	30	FTP PORT operation failed
CURLE_FTP_COULDNT_USE_REST	31	the REST command failed
CURLE_RANGE_ERROR	33	RANGE "command" didn't work
CURLE_HTTP_POST_ERROR	34	HTTP Post failed.
CURLE_SSL_CONNECT_ERROR	35	wrong when connecting with SSL
CURLE_BAD_DOWNLOAD_RESUME	36	couldn't resume download
CURLE_FILE_COULDNT_READ_FILE	37	Failed to read file.
CURLE_LDAP_CANNOT_BIND	38	LDAP can't connect.
CURLE_LDAP_SEARCH_FAILED	39	LDAP Search failed.
CURLE_FUNCTION_NOT_FOUND	41	Function not found.
CURLE_ABORTED_BY_CALLBACK	42	Transfer aborted with CURL.Cancel.
CURLE_BAD_FUNCTION_ARGUMENT	43	Bad parameters.
CURLE_INTERFACE_FAILED	45	CURL.OptionInterface failed
CURLE_TOO_MANY_REDIRECTS	47	catch endless re-direct loops
CURLE_UNKNOWN_TELNET_OPTION	48	User specified an unknown option
CURLE_TELNET_OPTION_SYNTAX	49	Malformed telnet option
CURLE_PEER_FAILED_VERIFICATION	51	peer's certificate or fingerprint wasn't verified fine
CURLE_GOT_NOHING	52	when this is a specific error
CURLE_SSL_ENGINE_NOTFOUND	53	SSL crypto engine not found
CURLE_SSL_ENGINE_SETFAILED	54	can not set SSL crypto engine as default
CURLE_SEND_ERROR	55	failed sending network data
CURLE_RECV_ERROR	56	failure in receiving network data
CURLE_SSL_CERTPROBLEM	58	problem with the local certificate
CURLE_SSL_CIPHER	59	couldn't use specified cipher
CURLE_SSL_CACERT	60	problem with the CA cert (path?)
CURLE_BAD_CONTENT_ENCODING	61	Unrecognized transfer encoding
CURLE_LDAP_INVALID_URL	62	Invalid LDAP URL
CURLE_FILESIZE_EXCEEDED	63	Maximum file size exceeded
CURLE_USE_SSL_FAILED	64	Requested FTP SSL level failed
CURLE_SEND_FAIL_REWIND	65	Sending the data requires a rewind that failed
CURLE_SSL_ENGINE_INITFAILED	66	failed to initialise ENGINE
CURLE_LOGIN_DENIED	67	user, password or similar was not accepted and we failed to login
CURLE_TFTP_NOTFOUND	68	file not found on server
CURLE_TFTP_PERM	69	permission problem on server
CURLE_REMOTE_DISK_FULL	70	out of disk space on server
CURLE_TFTP_ILLEGAL	71	Illegal TFTP operation
CURLE_TFTP_UNKNOWNID	72	Unknown transfer ID
CURLE_REMOTE_FILE_EXISTS	73	File already exists
CURLE_TFTP_NOSUCHUSER	74	No such user
CURLE_CONV_FAILED	75	conversion failed
CURLE_CONV_REQD	76	caller must register conversion callbacks
CURLE_SSL_CACERT_BADFILE	77	could not load CACERT file, missing or wrong format
CURLE_REMOTE_FILE_NOT_FOUND	78	remote file not found
CURLE_SSH	79	error from the SSH layer, somewhat generic so the error message will be of interest when this has happened
CURLE_SSL_SHUTDOWN_FAILED	80	Failed to shut down the SSL connection
CURLE_AGAIN	81	socket is not ready for send/rcv, wait till it's ready and try again.
CURLE_SSL_CRL_BADFILE	82	could not load CRL file, missing or wrong format.
CURLE_SSL_ISSUER_ERROR	83	Issuer check failed.
CURLE_FTP_PRET_FAILED	84	a PRET command failed
CURLE_RTSP_CSEQ_ERROR	85	mismatch of RTSP CSeq numbers
CURLE_RTSP_SESSION_ERROR	86	mismatch of RTSP Session Identifiers

61.143 CURL.PerformAsync

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	No	No	Yes

MBS("CURL.PerformAsync"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns OK or error.

Description

The query is enqueued and run by the plugin in background.

When transfer is finished, a script is triggered if you set one with `CURL.SetFinishedScript` function.

This function is called after the init and all the options are set, and will perform the transfer as described in the options. It must be called with the same handle as input as the `CURL.New` call returned.

You can do any amount of calls to `CURL.Perform` while using the same handle. If you intend to transfer more than one file, you are even encouraged to do so. `CURL` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use the option functions between the invokes to set options for the following `CURL.Perform`.

While transfer is running, your FileMaker application is not blocked. It's useful to show progress with using `CURL.SetUpdateProgressDialog`. Be aware that transfer runs in background and you should query status with functions like `CURL.IsRunning`, `CURL.GetProgressTotalDownload`, `CURL.GetProgressTotalUpload`, `CURL.GetProgressCurrentDownload` and `CURL.GetProgressCurrentUpload`.

Internal buffer for output, debug and header data is cleared before the perform.

Examples

Start a few transfers:

Go to Record/Request/Page [First]

Loop

Set Variable [\$curl; Value:MBS("CURL.New")]

Set Variable [\$r; Value:MBS("CURL.SetFinishedScript"; \$curl; Get(FileName); "DownloadFinished")]

Set Variable [\$r; Value:MBS("CURL.SetProgressScript"; \$curl; Get(FileName); "ProgressScript")]

Set Variable [\$r; Value:MBS("CURL.SetOptionURL"; \$curl; Download Async::URL)]

Set Variable [\$r; Value:MBS("CURL.SetTag"; \$curl; Get(RecordID))]

Set Field [Download Async::Progress; 0]

Set Field [Download Async::CURL Handle; \$curl]

Set Variable [\$r; Value:MBS("CURL.PerformAsync"; \$curl)]

```

If [ MBS("IsError") ]
Show Custom Dialog [ "CURL Error"; $r ]
End If
Commit Records/Requests [ Skip data entry validation; No dialog ]
Go to Record/Request/Page [ Next; Exit after last ]
End Loop

```

61.144 CURL.PerformInBackground

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.PerformInBackground"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Error code. 0 means everything was ok, non-zero means an error occurred.

Description

This function is called after the init and all the options are set, and will perform the transfer as described in the options. It must be called with the same handle as input as the CURL.New call returned.

You can do any amount of calls to PerformInBackground while using the same handle. If you intend to transfer more than one file, you are even encouraged to do so. CURL will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use the option functions between the invokes to set options for the following CURL.Perform.

You must never call this function simultaneously from two places using the same handle. Let the transfer finish first before invoking it another time. If you want parallel transfers, you must use several curl handles.

Internal buffer for output, debug and header data is cleared before the perform.

While transfer is running, your FileMaker application is not blocked. Be aware that transfer runs in background and you should query status with functions like CURL.IsRunning, CURL.GetProgressTotalDownload, CURL.GetProgressTotalUpload, CURL.GetProgressCurrentDownload and CURL.GetProgressCurrentUpload.

61.146 **CURL.ReceiveData**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.ReceiveData"; curl; BytesToRead { ; ResultType })

Parameters**curl**

The CURL session handle.

\$curl

BytesToRead

Maximum number of bytes to read.

1000

ResultType

Optional

What type of data to return. Can be hex or base64. Default is hex.

"hex"

Result Returns OK or error.

Description

This function receives raw data from the established connection. You may use it together with `SendData` to implement custom protocols using libcurl. This functionality can be particularly useful if you use proxies and/or SSL encryption: libcurl will take care of proxy negotiation and connection set-up.

`BytesToRead` is the maximum amount of data you want to read now. The function returns the text read, which can be less than requested.

To establish the connection, set `OptionConnectOnly = true` before calling `Perform`. Note that `ReceiveData` does not work on connections that were created without this option.

The call will return `CURLE_AGAIN` if there is no data to read - the socket is used in non-blocking mode internally. When `CURLE_AGAIN` is returned, wait for data to arrive.

Wait on the socket only if `ReceiveData` returns `CURLE_AGAIN`. The reason for this is libcurl or the SSL library may internally cache some data, therefore you should call `ReceiveData` until all data is read which would include any cached data.

Furthermore if you wait on the socket and it tells you there is data to read, `ReceiveData` may return `CURLE_AGAIN` if the only data that was read was for internal SSL processing, and no other data is available.

On success, sets error code to `CURLE_OK` (0) and returns the data.
On failure, returns zero and error code is set to the appropriate error code.

The function may return `CURLE_AGAIN`. In this case, use your operating system facilities to wait until data can be read, and retry.

Reading exactly 0 bytes indicates a closed connection.

If there's no socket available to use from the previous transfer, this function returns `CURL_EUNSUPPORTED_PROTOCOL`.

Please use `CURL.ErrorCode` to query error after you used this function.

61.147 CURL.ReceiveText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.2	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.ReceiveText"; curl; BytesToRead { ; Encoding } )
```

Parameters

curl

The CURL session handle.

\$curl

BytesToRead

Maximum number of bytes to read.

1000

Encoding

Optional

The text encoding for result. Default is UTF-8.

"UTF8"

Result Returns OK or error.

Description

This function receives raw data from the established connection. You may use it together with `SendData` to implement custom protocols using `libcurl`. This functionality can be particularly useful if you use proxies and/or SSL encryption: `libcurl` will take care of proxy negotiation and connection set-up.

`BytesToRead` is the maximum amount of data you want to read now. The function returns the text read, which can be less than requested.

To establish the connection, set `OptionConnectOnly = true` before calling `Perform`. Note that `ReceiveData` does not work on connections that were created without this option.

The call will return `CURLE_AGAIN` if there is no data to read - the socket is used in non-blocking mode internally. When `CURLE_AGAIN` is returned, wait for data to arrive.

Wait on the socket only if `ReceiveData` returns `CURLE_AGAIN`. The reason for this is `libcurl` or the SSL library may internally cache some data, therefore you should call `ReceiveData` until all data is read which would include any cached data.

Furthermore if you wait on the socket and it tells you there is data to read, `ReceiveData` may return `CURLE_AGAIN` if the only data that was read was for internal SSL processing, and no other data is available.

On success, sets error code to `CURLE_OK` (0) and returns the text.
On failure, returns zero and error code is set to the appropriate error code.

The function may return `CURLE_AGAIN`. In this case, use your operating system facilities to wait until data can be read, and retry.

Reading exactly 0 bytes indicates a closed connection.

If there's no socket available to use from the previous transfer, this function returns `CURL_EUNSUPPORTED_PROTOCOL`.

Please use `CURL.ErrorCode` to query error after you used this function.

Examples

Loop and read text from socket:

```
Set Variable [ $received; Value:"" ]
Loop
Pause/Resume Script [ Duration (seconds): ,1 ]
Set Variable [ $r; Value:MBS( "CURL.ReceiveText"; $curl; 10000; "UTF-8" ) ]
Set Variable [ $errorCode; Value:MBS( "CURL.ErrorCode"; $curl ) ]
If [ GetAsNumber ( $errorCode ) = 81 ]
# wait
Else If [ GetAsNumber ( $errorCode ) = 0 ]
# got some data
Set Variable [ $received; Value:$received & $r ]
Exit Loop If [ $r = "" ]
Else
# error
Exit Loop If [ 1 ]
End If
End Loop
Set Variable [ $received2; Value:MBS( "Text.ReplaceNewline"; $received; 1 ) ]
Set Field [ CURL Low Level Sockets::Data Received; $received2 ]
```

61.148 CURL.Reset

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.Reset"; curl)

Parameters**curl**

The CURL session handle.

\$curl

Result Returns OK or error.

Description

You don't need to reset the CURL session after calling CURL.New. The new curl session has no options set which could be cleared.

See also

- 61.139 CURL.New

1947

Created 8th July 2015, last changed 7th May 2016.

61.149 CURL.RunningTransfers

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.RunningTransfers")

Result Returns list or error.

Description

This list is empty if no transfer is running.
See also `CURL.NumberOfRunningTransfers` for just the count.

Examples

Shows list of running transfers:

```
Show Custom Dialog [ "Transfers in progress"; MBS( "CURL.RunningTransfers" ) ]
```

61.150 CURL.SendData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SendData"; curl; Data { ; DataType })

Parameters**curl**

The CURL session handle.

\$curl

Data

The data to send. Can be hex or base64 encoded text.

DataType

Optional

The data type to send. Can be Hex or Base64. Default is hex.

"hex"

Result Returns OK or error.

Description

This function sends arbitrary data over the established connection. You may use it together with Receive-Data to implement custom protocols using libcurl. This functionality can be particularly useful if you use proxies and/or SSL encryption: libcurl will take care of proxy negotiation and connection set-up.

Provide the data to send via parameter. We return the number of bytes sent.

To establish the connection, use `CURL.SetOptionConnectOnly` with value 1 before calling `CURL.Perform` function. Note that `SendData` will not work on connections that were created without this option.

The call will return empty and set error to `CURLE_AGAIN` (81) if it's not possible to send data right now - the socket is used in non-blocking mode internally. When `CURLE_AGAIN` is returned, please wait.

Furthermore if you wait on the socket and it tells you it's writable, `SendData` may return `CURLE_AGAIN` if the only data that was sent was for internal SSL processing, and no other data could be sent.

Please use `CURL.ErrorCode` to query error after you used this function.

61.151 CURL.SendText

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SendText"; curl; Text { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Text

The text to send.

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns OK or error.

Description

This function sends arbitrary data over the established connection. You may use it together with Receive-Data to implement custom protocols using libcurl. This functionality can be particularly useful if you use proxies and/or SSL encryption: libcurl will take care of proxy negotiation and connection set-up.

Provide the data to send via parameter. We return the number of bytes sent.

To establish the connection, use `CURL.SetOptionConnectOnly` with value 1 before calling `CURL.Perform` function. Note that `SendData` will not work on connections that were created without this option.

The call will return empty and set error to `CURLE_AGAIN` (81) if it's not possible to send data right now - the socket is used in non-blocking mode internally. When `CURLE_AGAIN` is returned, please wait.

61.152 CURL.SetBatchDestinationPath

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetBatchDestinationPath"; curl; Path)

Parameters**curl**

The CURL session handle.

\$curl

Path

The path to destination folder.

"/Users/cs/Desktop/"

Result Returns OK or error.

Description

See also [CURL.SetOptionWildcardMatch](#).

This function requires a native path. Use [Path.FileMakerPathToNativePath](#) to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use [FileDialog](#) functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer.

Examples

Download several files via FTP:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set URL with wildcard match
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
# Set folder where to put files
Set Variable [ $result; Value:MBS("CURL.SetBatchDestinationPath"; $curl; CURL Test::DestPath) ]
# credentials...
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
# enable wildcard match
Set Variable [ $result; Value:MBS("CURL.SetOptionWildcardMatch"; $curl; 1) ]
# download them all
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# check results
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Field [ CURL Test::FileNames; MBS("CURL.GetBatchFileNames"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.153 CURL.SetDebugWithData

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetDebugWithData"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Pass 1 to include all data or 0 to disable.

1

Result Returns OK or error.

Description

By default we don't include all the data in the debug log and just the messages.

This must be set before you call CURL.Perform function.

Examples

Enable data in debug:

MBS("CURL.SetDebugWithData"; \$curl; 1)

61.154 CURL.SetDebugWithProgress

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.3	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetDebugWithProgress"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new setting. Pass 1 to enable or 0 to disable.

1

Result Returns OK or error.

Description

By default we don't include progress messages in log.

Examples

Download with debug log with full details:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.CreateDebugOutputFile"; $curl; "/tmp/curl.log") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "http://www.monkeybreadsoftware.de/images/mbs.jpg") ]
Set Variable [ $result; Value:MBS("CURL.SetDebugWithTime"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetDebugWithProgress"; $curl; 1) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::Image; MBS("CURL.GetResultAsJPEG"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.155 CURL.SetDebugWithTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetDebugWithTime"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Pass 1 to include times or 0 to not include them.

1

Result Returns OK or error.

Description

This allows you to monitor what happens when.

e.g. see if login takes 10 seconds instead of 0.1.

Default is off.

This must be set before you call CURL.Perform function.

Examples

Load text and log with times:

```
# Start new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
# RUN now
Set Field [ CURL Test::Result; MBS("CURL.SetDebugWithTime"; $curl; 1) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetHeaderAsText"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.156 CURL.SetFinishedEvaluate

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	6.1	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetFinishedEvaluate"; curl; Expression)

Parameters**curl**

The CURL session handle.

\$curl

Expression

The expression to evaluate. Can be in local language of FileMaker Pro or english. For Server must always be in english.

"Let (\$\$Done = 1 ; 1)"

Result Returns OK or error.

Description

This only runs if you use CURL.PerformAsync.

In the expression the text \$\$ID\$\$ will be replaced when evaluated with the curl reference, so you can pass it to other functions if needed.

Examples

Sets expression to run when transfer is done:

```
Set Variable [ $result ; Value: MBS( "CURL.SetFinishedEvaluate"; $curl; "Let ( $$Done = 1 ; 1 )" ) ]
```

Free curl session when done:

```
# Start new session
```

```
Set Variable [ $curl ; Value: MBS("CURL.New") ]
```

```
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
```

```
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
```

```
Set Variable [ $result ; Value: MBS( "CURL.SetFinishedEvaluate"; $curl; "MBS(\"CURL.Cleanup\"; $$ID$$)" ) ]
```

```
# RUN now
```

```
Set Field [ CURL Test::Result ; MBS("CURL.PerformInBackground"; $curl) ]
```

- [MBS FileMaker Plugin, version 6.1pr5](#)
- [Evaluate vs. Script Trigger](#)

Created 4th March 2016, last changed 12nd November 2018.

61.157 CURL.SetFinishedScript

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.2	Yes	Yes	No	No	Yes

MBS("CURL.SetFinishedScript"; curl; Filename; ScriptName)

Parameters**curl**

The CURL session handle.

\$curl

Filename

The database file name where the script is located.

"test.fmp12"

ScriptName

The script name.

"MyScript"

Result Returns OK or error.

Description

This only runs if you use CURL.PerformAsync.

Does not work on server due to missing capability to trigger scripts in the plugin SDK with FileMaker Server.

With plugin version 6.0 or newer the script name can be a script ID number. In that case the plugin queries the script name for the given script ID. This allows to call scripts by ID and avoid problems if scripts are later renamed.

Examples

Start a curl session and setup a few scripts:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
```

```
Set Variable [ $r; Value:MBS("CURL.SetFinishedScript"; $curl; Get(FileName); "DownloadFinished") ]
```

```
Set Variable [ $r; Value:MBS("CURL.SetProgressScript"; $curl; Get(FileName); "ProgressScript") ]
```

61.158 CURL.SetInputFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetInputFile"; curl; data)

Parameters**curl**

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations.

To use a file from disk, please use `CURL.OpenInputFile`.

You may need to use `CURL.SetOptionUpload` to make it an upload for FTP/SFTP.

Using this function is not recommended for more than a 1 GB of data. If you need more, better stream the data with `CURL.OpenInputFile` from a file.

Examples

Upload data from container to FTP Server:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "ftp://test.test/test/hello.dat") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result; Value:MBS("CURL.SetInputFile"; $curl; CURL Test::MyContainer) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Upload file from container:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
```

FTP URL with destination file name:

```
Set Variable [ $result; Value: MBS("CURL.SetOptionURL" ; $curl ; "ftp://12.34.56.78/AZ1677ZZ.jpg") ]
Set Variable [ $result; Value: MBS("CURL.SetOptionUpload" ; $curl ; 1) ]
Set Variable [ $result; Value: MBS("CURL.SetOptionPassword" ; $curl ; "xxx" ) ]
```

```

Set Variable [ $result; Value: MBS("CURL.SetOptionUsername" ; $curl ; "yyy" ) ]

# Pick file from desktop:
// Set Variable [ $Desktop; Value: MBS("Folders.UserDesktop") ]
// Set Variable [ $Path; Value: MBS("Path.AddPathComponent"; $desktop; "AZ1677ZZ.jpg") ]
// Set Variable [ $result; Value: MBS( "CURL.OpenInputFile" ; $curl ;$path ) ]

# Pick file from container:
Set Variable [ $result; Value: MBS( "CURL.SetInputFile" ; $curl ; Test::ImageFileContainer ) ]

# Upload file
Set Field [ Test::PerformResult; MBS( "CURL.Perform" ; $curl ) ]
Set Field [ Test::DebugMessages; MBS( "CURL.GetDebugAsText" ; $curl ) ]
Set Variable [ $result; Value:MBS( "CURL.Cleanup" ; $curl ) ]

Do a POST request wiht input field:

Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL & CURL Test::file-
name) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionCustomRequest"; $curl; "POST") ]
Set Variable [ $result ; Value: MBS("CURL.SetInputFile"; $curl; CURL Test::Image) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionVerbose"; $curl; 1) ]
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

61.159 CURL.SetInputGIF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	3.1	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetInputGIF"; curl; data)

Parameters**curl**

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations.

Examples

Upload a GIF file to a FTP Server:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]

Created 18th August 2014, last changed 14th July 2016.

61.160 CURL.SetInputJPEG

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetInputJPEG"; curl; data)

Parameters**curl**

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations.

Examples

Upload a JPEG file to a FTP Server:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "ftp://test.test/test/hello.jpg") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result; Value:MBS("CURL.SetInputJPEG"; $curl; CURL Test::MyImage) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.161 CURL.SetInputPDF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	4.0	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetInputPDF"; curl; data)

Parameters**curl**

The CURL session handle.

\$curl

data

The container value with the data to upload.

\$pdfContainer

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations.

Examples

Upload a PDF file to a FTP Server:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "ftp://test.test/test/hello.pdf") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result; Value:MBS("CURL.SetInputPDF"; $curl; CURL Test::MyPDF) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetInputPNG"; curl; data)

Parameters

curl

The CURL session handle.

\$curl

data

The container value with the data to upload.

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations.

Examples

Upload some PNG image from container to FTP Server:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "ftp://test.test/test/hello.png") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result; Value:MBS("CURL.SetInputPNG"; $curl; CURL Test::MyImage) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Created 18th August 2014, last changed 14th July 2016.

61.163 `CURL.SetInputText`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.SetInputText"; curl; text { ; Encoding } )
```

Parameters

curl

The CURL session handle.

\$curl

text

The text to send.

Encoding

Optional

The text encoding for text parameter. Default is UTF-8 for version 10.0 or newer and native encoding before. "UTF-8"

Result Returns "OK" on success.

Description

Also sets input file length. You need to define input data for file uploads, http posts and http put operations. Please make sure you choose the text encoding the other side expects.

To avoid chunked transfer to server, you can also use `CURL.SetOptionPostFields` instead for text input.

If you set `CURL.SetOptionHTTPHeader` with `Transfer-Encoding` and/or `Expect`, you can disable chunked transfer.

For HTTP POST, please use `CURL.SetOptionPost` with 1 and `CURL.SetOptionPostFields` with your POST content using web services and other things.

Using this function is not recommended for more than a few hundred MB of text. If you need more, better stream the data with `CURL.OpenInputFile` from a file.

Examples

Set Text:

```
MBS("CURL.SetInputText"; $curl; "Hello World"; "utf8")
```

Set Text and disable Transfer Encodings and Expect header:

```
MBS("CURL.SetInputText"; $curl; "Hello World")
MBS("CURL.SetOptionHTTPHeader"; $curl; "Transfer-Encoding: "; "Expect:")
```

FTP Upload some text into a file on server:

```

Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "ftp://test.test/test/hello.txt") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result; Value:MBS("CURL.SetInputText"; $curl; "This is content to upload") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionVerbose"; $curl; 1) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Upload empty file with SFTP:

```

Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; "sftp://127.0.0.1/Users/cs/Desktop/test.txt"
) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionPassword"; $curl; "secret") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUsername"; $curl; "cs") ]
Set Variable [ $result ; Value: MBS("CURL.SetInputText"; $curl; "") ]
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

61.164 CURL.SetMultiOptionChunkLengthPenaltySize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetMultiOptionChunkLengthPenaltySize"; Value)

Parameters**Value**

The new value.

Result Returns OK or error.

Description

Only for asynchronous transfers with `CURL.PerformAsync`.

A connection with a chunk length longer than this will not be considered for pipelining.

See also

Created 14th April 2018, last changed 14th April 2018.

61.172 CURL.SetOptionAbstractUnixSocket

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionAbstractUnixSocket"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

See also [ABSTRACT_UNIX_SOCKET](#) option in CURL manual.

Created 15th April 2018, last changed 16th April 2018.

61.173 `CURL.SetOptionAcceptEncoding`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionAcceptEncoding"; curl; Param)

Parameters

curl

The CURL session handle.

\$curl

Param

The new setting.

1

Result Returns OK or error.

Description

Sets the contents of the Accept-Encoding: header sent in a HTTP request, and enables decoding of a response when a Content-Encoding: header is received. Three encodings are supported: identity, meaning non-compressed, deflate which requests the server to compress its response using the zlib algorithm, and gzip which requests the gzip algorithm.

If a zero-length string is set like "", then an Accept-Encoding: header containing all built-in supported encodings is sent.

You can also opt to just include the Accept-Encoding: header in your request with `CURL.SetOptionHTTPHeader` but then there will be no automatic decompressing when receiving data.

This is a request, not an order; the server may or may not do it. This option must be set or else any unsolicited encoding done by the server is ignored.

Servers might respond with Content-Encoding even without getting a Accept-Encoding: in the request.

Servers might respond with a different Content-Encoding than what was asked for in the request.

The Content-Length: servers send for a compressed response is supposed to indicate the length of the compressed content so when auto decoding is enabled it may not match the sum of bytes reported by the output buffer (although, sending the length of the non-compressed content is a common server mistake).

See also [ACCEPT_ENCODING](#) option in CURL manual.

Examples

Request gzip compression:

```
MBS( "CURL.SetOptionAcceptEncoding"; $curl; "gzip" )
```

Download with compression:

```
# Start new session
Set Variable [ $curl ; Value: MBS("CURL.New") ]
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
```

61.173. *CURL.SETOPTIONACCEPTENCODING*

2015

```
Set Variable [ $result ; Value: MBS("CURL.SetOptionAcceptEncoding"; $curl; "gzip") ]
# RUN now
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text ; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]
```

- [MBS FileMaker Plugin, version 9.5pr1](#)

Created 27th November 2017, last changed 27th November 2017.

61.174 `CURL.SetOptionAcceptTimeoutMS`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionAcceptTimeoutMS"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Time-out accept operations (currently for FTP only) after this amount of milliseconds.

See also [ACCEPTTIMEOUT_MS](#) option in CURL manual.

See also

- 61.173 `CURL.SetOptionAcceptEncoding` 2014

Created 15th April 2018, last changed 16th April 2018.

61.175 **CURL.SetOptionAddressScope**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionAddressScope"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

New scope ID.

1234

Result Returns "OK" on success.

Description

Pass a number specifying the scope_id value to use when connecting to IPv6 link-local or site-local addresses. See also [ADDRESS_SCOPE](#) option in CURL manual.

Created 18th August 2014, last changed 12nd July 2015.

61.176 CURL.SetOptionAppend

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionAppend"; curl; Value)

(old name: CURL.SetOptionFTPAppend)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to append.

1

Result Returns "OK" on success.

Description

A parameter set to 1 tells the library to append to the remote file instead of overwrite it. This is only useful when uploading to an FTP site.

See also **APPEND** option in CURL manual.

Examples

Turns append on:

MBS("CURL.SetOptionAppend"; \$curl; 1)

Turns append off:

MBS("CURL.SetOptionAppend"; \$curl; 0)

See also

- 61.225 CURL.SetOptionGet 2091

Created 18th August 2014, last changed 8th December 2016.

61.177 CURL.SetOptionAutoReferer

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionAutoReferer"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to automatically set referrer.

1

Result Returns "OK" on success.

Description

Pass a parameter set to 1 to enable this. When enabled, libcurl will automatically set the Referer: field in requests where it follows a Location: redirect.

See also [AUTOREFERER](#) option in CURL manual.

Examples

Turns referrer on:

MBS("CURL.SetOptionAutoReferer"; \$curl; 1)

See also

61.178 `CURL.SetOptionBufferSize`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionBufferSize"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The buffer size.

50000

Result Returns "OK" on success.

Description

Pass a number specifying your preferred size (in bytes) for the receive buffer in libcurl. The main point of this would be that the write callback gets called more often and with smaller chunks. This is just treated as a request, not an order. You cannot be guaranteed to actually get the given size.

This buffer size is by default `CURL_MAX_WRITE_SIZE` (16kB). The maximum buffer size allowed to be set is `CURL_MAX_READ_SIZE` (512kB). The minimum buffer size allowed to be set is 1024.

For slow upload/downloads, it may be better to set buffer size to 1 MB with `CURL.SetOptionUploadBufferSize` or `CURL.SetOptionBufferSize` properties to make transfers faster. See also [BUFFERSIZE](#) option in CURL manual.

Examples

Sets buffer size:

MBS("CURL.SetOptionBufferSize"; \$curl; 1024*1024)

61.179 `CURL.SetOptionCAINFO`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCAINFO"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The file path for the certificates.

"/test.pem"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Pass a string naming a file holding one or more certificates to verify the peer with. This makes sense only when used in combination with the `CURL.SetOptionVerifyPeer` option. If `CURL.SetOptionVerifyPeer` is zero, `CURL.SetOptionCAInfo` need not even indicate an accessible file.

This option is by default set to the system path where libcurl's cacert bundle is assumed to be stored, as established at build time.

When built against NSS, this is the directory that the NSS certificate database resides in.

see also

http://www.mbsplugins.de/archive/2013-01-31/SSL_Security_with_CURL/monkeybreadsoftware_blog_archive

Starting with version 8.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

See also **CAINFO** option in CURL manual.

Examples

Enables verification and uses cacert.pem file for certificates:

```
MBS( "CURL.SetOptionCAInfo"; $curl; $cacertPath )
```

```
MBS( "CURL.SetOptionSSLVerifyHost"; $curl; 2 )
```

```
MBS( "CURL.SetOptionSSLVerifyPeer"; $curl; 1 )
```

Use FileMaker's root file in CURL:

```
Set Variable [ $curl ; Value: MBS("CURL.New") ]
#
If [ MBS("IsIOS") ]
# look for path to certificate file
Set Variable [ $path ; Value: Substitute(MBS("Folders.UserDocuments"); "/Documents"; "/Library/Application Support/FileMaker/iOS/1.0/root.pem") ]
If [ MBS("Files.FileExists"; $path) ]
# use in CURL
Set Variable [ $r ; Value: MBS( "CURL.SetOptionCAINFO"; $curl; $path) ]
Else
Show Custom Dialog [ "File not found." ; $path ]
End If
Else If [ MBS("IsMacOSX") ]
# look for path to certificate file
Set Variable [ $path ; Value: Substitute(MBS("Folders.UserDocuments"); "/Documents"; "/Library/Application Support/FileMaker/Shared/17.0/root.pem") ]
If [ MBS("Files.FileExists"; $path) ]
# use in CURL
Set Variable [ $r ; Value: MBS( "CURL.SetOptionCAINFO"; $curl; $path) ]
Else
Show Custom Dialog [ "File not found." ; $path ]
End If
Else If [ MBS("IsWindows") ]
# look for path to certificate file
Set Variable [ $path ; Value: Substitute(MBS("Folders.UserDocuments"); "\\Documents"; "\\AppData\\Local\\FileMaker\\FileMaker Pro Advanced\\17.0\\root.pem") ]
If [ MBS("Files.FileExists"; $path) ]
# use in CURL
Set Variable [ $r ; Value: MBS( "CURL.SetOptionCAINFO"; $curl; $path) ]
Else
Show Custom Dialog [ "File not found." ; $path ]
End If
Else If [ MBS("IsLinux") ]
# look for path to certificate file
Set Variable [ $path ; Value: "/FileMakerData/Extensions/OpenSSL/root.pem" ]
# use in CURL
Set Variable [ $r ; Value: MBS( "CURL.SetOptionCAINFO"; $curl; $path) ]
End If
```

61.180 CURL.SetOptionCAPATH

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCAPATH"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The path to certificates directory.

"/data/MyCertificates"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns "OK" on success.

Description

Pass a string naming a directory holding multiple CA certificates to verify the peer with. The certificate directory must be prepared using the openssl c_rehash utility. This makes sense only when used in combination with the CURL.SetOptionVerifyPeer option. If CURL.SetOptionVerifyPeer is zero, CURL.SetOptionCAPATH need not even indicate an accessible path. The CURL.SetOptionCAPath function apparently does not work in Windows due to some limitation in openssl. This option is OpenSSL-specific and does nothing if libcurl is built to use GnuTLS.

Starting with version 8.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

See also [CAPATH](#) option in CURL manual.

Created 18th August 2014, last changed 12nd December 2017.

61.181 CURL.SetOptionCRLF

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCRLF"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to convert newline characters.

1

Result Returns "OK" on success.

Description

If the value is set to 1 (one), libcurl converts Unix newlines to CRLF newlines on transfers. Disable this option again by setting the value to 0 (zero).

This is a legacy option of questionable use.

See also [CRLF](#) option in CURL manual.

61.182 `CURL.SetOptionCRLFile`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCRLFile"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The new file path.

"C:\FileMaker\Stuff\test.pem"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Pass a string naming a file with the concatenation of CRL (in PEM format) to use in the certificate validation that occurs during the SSL exchange.

When curl is built to use NSS or GnuTLS, there is no way to influence the use of CRL passed to help in the verification process. When libcurl is built with OpenSSL support, `X509_V_FLAG_CRL_CHECK` and `X509_V_FLAG_CRL_CHECK_ALL` are both set, requiring CRL check against all the elements of the certificate chain if a CRL file is passed.

This option makes sense only when used in combination with the `CURL.SetOptionVerifyPeer` option.

A specific error code (`CURLE_SSL_CRL_BADFILE`) is defined with the option. It is returned when the SSL exchange fails because the CRL file cannot be loaded. A failure in certificate verification due to a revocation information found in the CRL does not trigger this specific error.

See also [CRLFILE](#) option in CURL manual.

61.183 `CURL.SetOptionCertInfo`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCertInfo"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to collect certificate information.

1

Result Returns "OK" on success.

Description

Pass a long set to 1 to enable libcurl's certificate chain info gatherer. With this enabled, libcurl (if built with OpenSSL) will extract lots of information and data about the certificates in the certificate chain used in the SSL connection. This data is then possible to extract after a transfer using `CURL.GetCertInfo`. See also [CERTINFO](#) option in CURL manual.

Examples

Query certificate information for MBS website:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://www.monkeybreadsoftware.de/") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionCertInfo"; $curl; 1) ]
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
Set Field [ CURL Test::Text; MBS("CURL.GetCertInfo"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.184 `CURL.SetOptionConnectOnly`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	7.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionConnectOnly"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

A 1 tells the library to perform any required proxy authentication and connection setup, but no data transfer.

Use this option to tell CURL to connect only and then send/receive data with your own protocol.

See `CURL.SendData`, `CURL.SendText`, `CURL.ReceiveText` and `CURL.ReceiveData`.

See also [CONNECT_ONLY](#) option in CURL manual.

Examples

Download website and handle protocol ourself:

```
# Start new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
Set Variable [ $result; Value:MBS("CURL.SetOptionConnectOnly"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; CURL Low Level Sockets::URL) ]
Set Variable [ $request; Value:"GET / HTTP/1.1$Host: www.monkeybreadsoftware.de$$" // must end with
two empty lines ]
Set Variable [ $request2; Value:MBS( "Text.ReplaceNewline"; $request; 3) ]
# RUN now
Set Field [ CURL Low Level Sockets::Connect Result; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Low Level Sockets::Data Received; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Low Level Sockets::Debug Messages; MBS("CURL.GetDebugAsText"; $curl) ]
If [ CURL Low Level Sockets::Connect Result = "OK" ]
Set Variable [ $r; Value:MBS( "CURL.SendText"; $curl; $request2; "UTF-8") ]
Set Field [ CURL Low Level Sockets::Data Sent; $request ]
Set Variable [ $received; Value:"" ]
Loop
Pause/Resume Script [ Duration (seconds): ,1 ]
```

```

Set Variable [ $r; Value:MBS( "CURL.ReceiveText"; $curl; 10000; "UTF-8" ) ]
Set Variable [ $errorCode; Value:MBS( "CURL.ErrorCode"; $curl ) ]
If [ GetAsNumber ( $errorCode ) = 81 ]
# wait
Else If [ GetAsNumber ( $errorCode ) = 0 ]
# got some data
Set Variable [ $received; Value:$received & $r ]
Exit Loop If [ $r = "" ]
Else
# error
Exit Loop If [ 1 ]
End If
End Loop
Set Variable [ $received2; Value:MBS( "Text.ReplaceNewline"; $received; 1 ) ]
Set Field [ CURL Low Level Sockets::Debug Messages; MBS("CURL.GetDebugAsText"; $curl) ]
Set Field [ CURL Low Level Sockets::Data Received; $received2 ]
End If
# Cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Check if SMB (port 445) is open on a given IP in network:

```

Let ( [
curl = MBS("CURL.New");
a = MBS( "CURL.SetOptionConnectOnly"; curl; 1 );
b = MBS( "CURL.SetOptionURL"; curl; "192.168.2.117" );
c = MBS( "CURL.SetOptionConnectionTimeout"; curl; 1 );
d = MBS( "CURL.SetOptionPort"; curl; 445 );
r = MBS( "CURL.Perform"; curl );
x = MBS( "CURL.Cleanup"; curl )
]; r )
// returns either
// OK
// or
// 28: Connection timed out after 1000 milliseconds

```

61.185 CURL.SetOptionConnectTimeoutMS

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionConnectTimeoutMS"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The connection timeout time in milliseconds.

300000

Result Returns "OK" on success.

Description

Like `CURL.SetOptionConnectionTimeout` but takes the number of milliseconds instead. If libcurl is built to use the standard system name resolver, that portion of the connect will still use full-second resolution for timeouts with a minimum timeout allowed of one second.

See also [CONNECTTIMEOUT_MS](#) option in CURL manual.

See also

- 61.174 `CURL.SetOptionAcceptTimeoutMS` 2016
- 61.187 `CURL.SetOptionConnectionTimeout` 2037

Created 18th August 2014, last changed 18th August 2014.

61.186 `CURL.SetOptionConnectTo`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionConnectTo"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Sets list of host:port:connect-to-host:connect-to-port, overrides the URL's host:port (only for the network layer)

See also [CONNECT_TO](#) option in CURL manual.

See also

- 61.79 `CURL.GetOptionConnectTo` 1872

Created 15th April 2018, last changed 16th April 2018.

61.187 CURL.SetOptionConnectionTimeout

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionConnectionTimeout"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The connection timeout time in seconds.

300

Result Returns "OK" on success.

Description

Pass the maximum time in seconds that you allow the connection to the server to take. This only limits the connection phase, once it has connected, this option is of no more use. Set to zero to switch to the default built-in connection timeout - 300 seconds. See also the `CURL.SetOptionTimeout` option.

See also [CONNECTTIMEOUT](#) option in CURL manual.

Examples

Set timeout to 30 seconds:

```
MBS( "CURL.SetOptionConnectionTimeout"; $curl; 30 )
```

Check if SMB (port 445) is open on a given IP in network:

```
Let ( [
curl = MBS("CURL.New");
a = MBS( "CURL.SetOptionConnectOnly"; curl; 1 );
b = MBS( "CURL.SetOptionURL"; curl; "192.168.2.117" );
c = MBS( "CURL.SetOptionConnectionTimeout"; curl; 1 );
d = MBS( "CURL.SetOptionPort"; curl; 445 );
r = MBS( "CURL.Perform"; curl );
x = MBS( "CURL.Cleanup"; curl)
]; r )
// returns either
// OK
// or
// 28: Connection timed out after 1000 milliseconds
```

61.188 CURL.SetOptionCookie

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCookie"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The cookie string.

""

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns "OK" on success.

Description

Pass a cookie string. It will be used to set a cookie in the http request. The format of the string should be NAME=CONTENTS, where NAME is the cookie name and CONTENTS is what the cookie should contain.

If you need to set multiple cookies, you need to set them all using a single option and thus you need to concatenate them all in one single string. Set multiple cookies in one string like this: "name1=content1; name2=content2;" etc.

This option sets the cookie header explicitly in the outgoing request(s). If multiple requests are done due to authentication, followed redirections or similar, they will all get this cookie passed on.

Using this option multiple times will only make the latest string override the previous ones.

Cookie format is explained here:

<https://humanwhocodes.com/blog/2009/05/05/http-cookies-explained/>

See also **COOKIE** option in CURL manual.

Examples

Pass 4 cookies together:

```
MBS( "CURL.SetOptionCookie"; $curl; "ORA_WX_SESSION="32230CEE0E940BDF8157FEF3EB58E9CBD8A5699-3# 1"; ObSSOCookie=VPAEWqhsUTbSXpHB0% 3BqRDXNegpZBgeCgR1GJ3Ysou0A5% 3FyUdO0ffMSHU17fN0mg4cVonl

61.189 CURLOPT.SetOptionCookieFile

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURLOPT.SetOptionCookieFile"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The file path to the cookie file.

"/tmp/cookies.txt"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Pass a file path for the cookie file. It should contain the name of your file holding cookie data to read. The cookie data may be in Netscape / Mozilla cookie data format or just regular HTTP-style headers dumped to a file.

Given an empty or non-existing file or by passing the empty string (""), this option will enable cookies for this curl handle, making it understand and parse received cookies and then use matching cookies in future requests.

If you use this option multiple times, you just add more files to read. Subsequent files will add more cookies.

Starting with version 8.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

See also **COOKIEFILE** option in CURL manual.

Examples

Activate cookie engine without cookie file:

```
MBS( "CURLOPT.SetOptionCookieFile"; $curl; "" )
```

Perform SOAP service with login and use cookies in second request:

```

# The URL of the service
Set Variable [ $url ; Value: "http://somedomain.com/PartnerService17.asmx" ]
# Build XML for SOAP Login request, e.g. with MBS XML functions or simply substitute()
Set Variable [ $xml ; Value: "<?xml version=\"1.0\" encoding=\"utf-8\"?><soap:Envelope xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" xmlns:xsd=\"http://www.w3.org/2001/XMLSchema\" xmlns:soap=\"http://schemas.xmlsoap.org/soap/envelope/\"><soap:Body></soap:Body>..." ]
Set Field [ Curl_Test::XML ; $xml ]
# The SOAP action to use
Set Variable [ $action ; Value: "http://somedomain.com/partner/loginWithLicenceUnlockInfo" ]
#
# Setup transfer
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; $url) ]
# Put SOAP action and XML data type in the headers
Set Variable [ $result ; Value: MBS("CURL.SetOptionHTTPHeader"; $curl; "Content-Type: text/xml; charset=utf-8"; "Expect: "; "SOAPAction: \"\"& $action & \"\"") ]
# Ask CURL to manage cookies
Set Variable [ $result ; Value: MBS("CURL.SetOptionCookieFile"; $curl; "" ) ]
# Set the payload for the login transfer
Set Variable [ $result ; Value: MBS("CURL.SetOptionPostFields"; $curl; $xml) ]
# Run transfer
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
# Let's take a look on the cookie list
Set Variable [ $$cookie ; Value: MBS("CURL.GetCookieList"; $curl) ]
Set Field [ Curl_Test::Cookie ; $$cookie ]
# Check result
Set Field [ Curl_Test::Debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Field [ Curl_Test::Resultat ; $result ]
#
# Reuse same $curl for second request reusing existing cookies
#
# Make new XML for second request
Set Variable [ $npk ; Value: "103" ]
# Build XML for SOAP Login request, e.g. with MBS XML functions or simply substitute()
Set Variable [ $xml ; Value: "<soap:Envelope xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" xmlns:xsd=\"http://www.w3.org/2001/XMLSchema\" xmlns:soap=\"http://schemas.xmlsoap.org/soap/envelope/\"><soap:Body></soap:Body></soap:Envelope>" ]
Set Field [ Curl_Test::XML ; $xml ]
Set Variable [ $action ; Value: "http://somedomain.com/partner/queryInfo" ]
#
# Setup transfer
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; $url) ]
# Put SOAP action and XML data type in the headers
Set Variable [ $result ; Value: MBS("CURL.SetOptionHTTPHeader"; $curl; "Content-Type: text/xml; charset=utf-8"; "Expect: "; "SOAPAction: \"\"& $action & \"\"") ]
# Set the payload for the second transfer
Set Variable [ $result ; Value: MBS("CURL.SetOptionPostFields"; $curl; $xml) ]

```

```
# Run transfer
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ Curl_Test::Debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Field [ Curl_Test::Resultat ; $result ]
# Finally end curl session
Set Variable [ $r ; Value: MBS("CURL.Cleanup"; $curl) ]
```

61.189.1 Blog Entries

- [Let CURL handle cookie list](#)
- [MBS FileMaker Plugin, version 7.6pr3](#)

Created 18th August 2014, last changed 28th February 2019.

61.190 `CURL.SetOptionCookieJar`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCookieJar"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The file path.

"/tmp/cookies.txt"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns "OK" on success.

Description

Pass a file name as string. This will make libcurl write all internally known cookies to the specified file when `CURL.Cleanup` is called. If no cookies are known, no file will be created. Specify "-" to instead have the cookies written to stdout. Using this option also enables cookies for this session, so if you for example follow a location it will make matching cookies get sent accordingly.

If the cookie jar file can't be created or written to (when the `CURL.Cleanup` is called), libcurl will not and cannot report an error for this. Using `CURL.SetOptionVerbose` or using Debug output will get a warning to display, but that is the only visible feedback you get about this possibly lethal situation.

Starting with version 8.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

See also [COOKIEJAR](#) option in CURL manual.

Examples

Activate cookie engine without cookie file:

```
MBS( "CURL.SetOptionCookieFile"; $curl; "" )
```

- [MBS FileMaker Plugin, version 7.6pr3](#)

Created 18th August 2014, last changed 27th February 2019.

61.191 `CURL.SetOptionCookieList`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCookieList"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The cookie string.

"Set-Cookie: value = ..."

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Cookie can be either in Netscape / Mozilla format or just regular HTTP-style header (Set-Cookie: ...) format. If cURL cookie engine was not enabled it will enable its cookie engine. Passing a magic string "ALL" will erase all cookies known by cURL. Passing the special string "SESS" will only erase all session cookies known by cURL. Passing the special string "FLUSH" will write all cookies known by cURL to the file specified by `CURL.SetOptionCookieJar`.

See also [COOKIELIST](#) option in CURL manual.

61.192 CURL.SetOptionCookieSession

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCookieSession"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether this is a new cookie session.

1

Result Returns "OK" on success.

Description

It will force libcurl to ignore all cookies it is about to load that are "session cookies" from the previous session. By default, libcurl always stores and loads all cookies, independent if they are session cookies or not. Session cookies are cookies without expiry date and they are meant to be alive and existing for this "session" only.

See also [COOKIESESSION](#) option in CURL manual.

Created 18th August 2014, last changed 18th August 2014.

61.193 `CURL.SetOptionCustomRequest`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionCustomRequest"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The custom request string.

"PUT"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns "OK" on success.

Description

Pass a text string as parameter. It will be used instead of GET or HEAD when doing an HTTP request, or instead of LIST or NLST when doing a FTP directory listing. This is useful for doing DELETE or other more or less obscure HTTP requests. Don't do this at will, make sure your server supports the command first.

When you change the request method by setting `CURL.SetOptionCustomRequest` to something, you don't actually change how libcurl behaves or acts in regards to the particular request method, it will only change the actual string sent in the request.

For example: if you tell libcurl to do a HEAD request, but then change the request to a "GET" with `CURL.SetOptionCustomRequest` you'll still see libcurl act as if it sent a HEAD even when it does send a GET.

To switch to a proper HEAD, use `CURL.SetOptionNoBody`, to switch to a proper POST, use `CURL.SetOptionPost` and `CURL.SetOptionPostFields`.

Restore to the internal default by setting this to "".

Many people have wrongly used this option to replace the entire request with their own, including multiple headers and POST contents. While that might work in many cases, it will cause libcurl to send invalid requests and it could possibly confuse the remote server badly. Use `CURL.SetOptionPost` and `CURL.SetOptionPostFields` to set POST data. Use `CURL.SetOptionHTTPHeader` to replace or extend the set of

headers sent by libcurl. Use `CURL.SetOptionHTTPVersion` to change HTTP version.
See also **CUSTOMREQUEST** option in CURL manual.

Examples

Sets request POST:

```
MBS( "CURL.SetOptionPost"; $curl; 1 )
```

Advanced file listing for FTP:

```
MBS( "CURL.SetOptionCustomRequest"; $curl; "MLSD" )
```

Set delete request:

```
MBS( "CURL.SetOptionCustomRequest"; $curl; "DELETE" )
```

Fetch email flags for IMAP:

```
MBS( "CURL.SetOptionCustomRequest"; $curl; "FETCH 1:* FLAGS" )
```

Sets custom request PATCH:

```
MBS( "CURL.SetOptionCustomRequest"; $curl; "PATCH" )
```

IMAP fetch all email list with MessageID included:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionCustomRequest"; $curl; "FETCH 1:* (FLAGS BODY.PEEK  
[ HEADER.FIELDS (Message-Id) ] )") ]
```

Mark email to be deleted via IMAP:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionCustomRequest"; $curl; "STORE " & $EmailID & " +FLAGS  
(\DELETED)") ]
```

Delete emails via IMAP:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionCustomRequest"; $curl; "EXPUNGE") ]
```

Delete email via POP3:

```
# Start new session  
Set Variable [ $curl; Value:MBS("CURL.New") ]  
# You can specify the message either in the URL or DELE command  
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "pop3://pop.monkeybreadsoftware.de/1")  
]
```

```

# put credentials in place
Set Variable [ $result; Value:MBS("CURL.SetOptionUserName"; $curl; "xxx@macsw.de") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; "xxx") ]
# Set the DELE command
Set Variable [ $result; Value:MBS("CURL.SetOptionCustomRequest"; $curl; "DELE") ]
# Do not perform a transfer as DELE returns no data
Set Variable [ $result; Value:MBS("CURL.SetOptionNoBody"; $curl; 1) ]
# Perform the custom request
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

Set deleted flag for email with IMAP:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionCustomRequest"; $curl; "STORE 123 +Flags \\Deleted") ]
```

Query POP3 capabilities with UIDL request:

```

// This is a simple example using CURL's POP3 capabilities to list the contents of a mailbox.
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
Set Field [ CURL Test::Result ; MBS("CURL.SetOptionCustomRequest"; $curl; "UIDL") ]
Set Field [ CURL Test::Result ; MBS("CURL.SetOptionPassword"; $curl; "xxx") ]
Set Field [ CURL Test::Result ; MBS("CURL.SetOptionUsername"; $curl; "yyy") ]
# Run transfer
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text ; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header ; MBS("CURL.GetHeaderAsText"; $curl) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

Query headers of first email via POP3:

```

# TOP x y
# x = ID of email, starting at 1
# y = number of lines, default all.
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; CURL Test::URL) ]
Set Field [ CURL Test::Result ; MBS("CURL.SetOptionCustomRequest"; $curl; "TOP 1 0") ]
Set Field [ CURL Test::Result ; MBS("CURL.SetOptionPassword"; $curl; "xxx") ]
Set Field [ CURL Test::Result ; MBS("CURL.SetOptionUsername"; $curl; "yyy") ]
# Run transfer

```

```

Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text ; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header ; MBS("CURL.GetHeaderAsText"; $curl) ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

IMAP Email moving.

```

Set Variable [ $URL ; Value: "imap://" & EmailClient::Server & "/INBOX" ]
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionURL"; $curl; $URL) ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionUserName"; $curl; EmailClient::Username) ]
Set Variable [ $r ; Value: MBS("CURL.SetOptionPassword"; $curl; EmailClient::Password) ]
# Move email 1 to folder test
Set Variable [ $r ; Value: MBS("CURL.SetOptionCustomRequest"; $curl; "MOVE 1 INBOX.test") ]
Set Variable [ $result ; Value: MBS("CURL.Perform"; $curl) ]
Set Variable [ $output ; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Variable [ $debug ; Value: MBS("CURL.GetDebugAsText"; $curl) ]
Set Field [ EmailClient::ErrorLog ; $debug ]
Set Variable [ $r ; Value: MBS("CURL.Cleanup"; $curl) ]

```

Create folder via WebDAV:

```
Set Variable [ $r ; Value: MBS("CURL.SetOptionCustomRequest"; $curl; "MKCOL") ]
```

Query quota details for IMAP:

```
MBS( "CURL.SetOptionCustomRequest"; $curl; "GETQUOTA" )
```

Created 18th August 2014, last changed 29th June 2019.

61.194 CURL.SetOptionDNSCacheTimeout

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionDNSCacheTimeout"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new timeout in seconds.

60

Result Returns "OK" on success.

Description

Name resolves will be kept in memory for this number of seconds. Set to zero to completely disable caching, or set to -1 to make the cached entries remain forever. By default, libcurl caches this info for 60 seconds.

The name resolve functions of various libc implementations don't re-read name server information unless explicitly told so (for example, by calling `res_init(3)`). This may cause libcurl to keep using the older server even if DHCP has updated the server info, and this may look like a DNS cache issue to the casual libcurl-app user.

See also [DNS_CACHE_TIMEOUT](#) option in CURL manual.

61.199 CURLOPT.SetOptionDNSShuffleAddresses

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURLOPT.SetOptionDNSShuffleAddresses"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The new setting, 1 or 0

1

Result Returns OK or error.

Description

When a name is resolved and more than one IP address is returned, shuffle the order of all returned addresses so that they will be used in a random order. This is similar to the ordering behavior of `gethostbyname` which is no longer used on most platforms.

Addresses will not be reshuffled if a name resolution is completed using the DNS cache. `CURLOPT.SetOptionDNSShuffleAddresses` can be used together with this option to reduce DNS cache timeout or disable caching entirely if frequent reshuffling is needed.

Since the addresses returned will be reordered randomly, their order will not be in accordance with RFC 3484 or any other deterministic order that may be generated by the system's name resolution implementation. This may have performance impacts and may cause IPv4 to be used before IPv6 or vice versa.

Default is 0.

See also [DNS_SHUFFLE_ADDRESSES](#) option in CURL manual.

Created 16th May 2018, last changed 16th May 2018.

61.200 CURL.SetOptionDOHURL

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionDOHURL"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new URL.

Result Returns OK or error.

Description

Pass in a string to a URL for the DOH server to use for name resolving. The parameter should be URL-encoded in the following format: "https://host:port/path". It MUST specify a HTTPS URL.

libcurl doesn't validate the syntax or use this variable until the transfer is issued. Even if you set a crazy value here, CURL.SetOptionDOHURL will still return OK.

curl sends POST requests to the given DNS-over-HTTPS URL.

To find the DOH server itself, which might be specified using a name, libcurl will use the default name lookup function. You can bootstrap that by providing the address for the DOH server with CURL.SetOptionResolve.

Disable DOH use again by setting this option to "".

See also [DOH_URL](#) option in CURL manual.

Created 15th April 2018, last changed 16th April 2018.

61.202 `CURL.SetOptionDirListOnly`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionDirListOnly"; curl; Value)

(old name: `CURL.SetOptionFTPListOnly`)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to limit directory listing to names only.

1

Result Returns "OK" on success.

Description

A parameter set to 1 tells the library to just list the names of files in a directory, instead of doing a full directory listing that would include file sizes, dates etc. This works for FTP and SFTP URLs.

This causes an FTP NLST command to be sent on an FTP server. Beware that some FTP servers list only files in their response to NLST; they might not include subdirectories and symbolic links.

See also **DIRLISTONLY** option in CURL manual.

Examples

List only file names:

```
MBS( "CURL.SetOptionDirListOnly"; $curl; 1 )
```

Full listing:

```
MBS( "CURL.SetOptionDirListOnly"; $curl; 0 )
```

Query list of files in FTP/SFTP folder:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
# set download URL, e.g. sftp://monkeybreadsoftware.net/
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; SFTP Download::URL ) ]
# set credentials
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; SFTP Download::UserName ) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; SFTP Download::Password ) ]
# login only via password
```

61.202. *CURL.SETOPTIONDIRLISTONLY*

2063

```
Set Variable [ $result; Value:MBS( "CURL.SetOptionSSHAAuthTypes"; $curl; 2+8 ) ]  
# only get list of file/dir names  
Set Variable [ $result; Value:MBS("CURL.SetOptionDirListOnly"; $curl; 1) ]  
# run transfer  
Set Field [ SFTP Download::ErrorCode; MBS("CURL.Perform"; $curl) ]  
# check debug log for errors  
Set Field [ SFTP Download::Debug; MBS("CURL.GetDebugAsText"; $curl) ]  
Set Field [ SFTP Download::FileList; MBS("CURL.GetResultAsText"; $curl) ]  
# free CURL session  
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.203 `CURL.SetOptionDisallowUserNameInURL`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.3	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.SetOptionDisallowUserNameInURL"; curl; Value )
```

Parameters

curl

The CURL session handle.

\$curl

Value

The option value. Can be 1 to disable or 0 to enable.

1

Result Returns OK or error.

Description

The value 1 tells the library to not allow URLs that include an username.

Having password and username in the URL is a bad idea as you tell every proxy server your secret and the URLs appear on all proxy and the final web server right in the log files.

See also [DISALLOW_USERNAME_IN_URL](#) option in CURL manual.

Examples

Enable passwords in the URL:

```
MBS( "CURL.SetOptionDisallowUserNameInURL"; $curl; 1 )
```

61.203.1 Blog Entries

61.204 CURL.SetOptionEGDSocket

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionEGDSocket"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The path to the socket.

""

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

It will be used to seed the random engine for SSL.

See also **EGDSOCKET** option in CURL manual.

Created 18th August 2014, last changed 5th July 2015.

61.205 `CURL.SetOptionExpect100TimeoutMS`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionExpect100TimeoutMS"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Time to wait in milliseconds for a response to a HTTP request containing an Expect: 100-continue header before sending the data anyway.

See also [EXPECT_100_TIMEOUT_MS](#) option in CURL manual.

See also

- 61.174 `CURL.SetOptionAcceptTimeoutMS` 2016

Created 15th April 2018, last changed 16th April 2018.

61.206 CURL.SetOptionFTPAccount

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPAccount"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The account name.

"test"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

When an FTP server asks for "account data" after user name and password has been provided, this data is sent off using the ACCT command.

See also [FTP_ACCOUNT](#) option in CURL manual.

See also

Created 18th August 2014, last changed 5th July 2015.

61.207 `CURL.SetOptionFTPAlternativeToUser`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPAlternativeToUser"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to use alternative user command.

1

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Pass a string which will be used to authenticate if the usual FTP "USER user" and "PASS password" negotiation fails. This is currently only known to be required when connecting to Tumbleweed's Secure Transport FTPS server using client certificates for authentication.

See also [FTP_ALTERNATIVE_TO_USER](#) option in CURL manual.

Created 18th August 2014, last changed 5th July 2015.

61.208 CURL.SetOptionFTPCreateMissingDirs

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPCreateMissingDirs"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to create missing directories. (1, 2 or 0)

2

Result Returns "OK" on success.

Description

Pass a number. If the value is 1, curl will attempt to create any remote directory that it fails to CWD into. CWD is the command that changes working directory.

This setting also applies to SFTP-connections. curl will attempt to create the remote directory if it can't obtain a handle to the target-location. The creation will fail if a file of the same name as the directory to create already exists or lack of permissions prevents creation.

Starting with 7.19.4, you can also set this value to 2, which will make libcurl retry the CWD command again if the subsequent MKD command fails. This is especially useful if you're doing many simultaneous connections against the same server and they all have this option enabled, as then CWD may first fail but then another connection does MKD before this connection and thus MKD fails but trying CWD works!

See also [FTP_CREATE_MISSING_DIRS](#) option in CURL manual.

Examples

Upload via FTP with creation of missing folders:

```
Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; "ftp://ftp.monkeybreadsoftware.net/missingFolder/hello.txt") ]
# create any missing folders when uploading
Set Variable [ $result ; Value: MBS("CURL.SetOptionFTPCreateMissingDirs"; $curl; 1) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
# we upload some text here.
Set Variable [ $result ; Value: MBS("CURL.SetInputText"; $curl; "Hello World!") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUpload"; $curl; 1) ]
# Run transfer
```

```

Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check debug messages for errors
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

Upload via SFTP and create missing directories:

```

Set Variable [ $curl ; Value: MBS("CURL.New") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; "sftp://ftp.monkeybreadsoftware.net/missingFolder/hello.txt") ]
# create any missing folders when uploading
Set Variable [ $result ; Value: MBS("CURL.SetOptionFTPCreateMissingDirs"; $curl; 1) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionSSHAuthTypes"; $curl; 2+8 ) ]
# we upload some text here.
Set Variable [ $result ; Value: MBS("CURL.SetInputText"; $curl; "Hello World!") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionUpload"; $curl; 1) ]
# Run transfer
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check debug messages for errors
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

Created 18th August 2014, last changed 27th May 2017.

61.209 `CURL.SetOptionFTPFileMethod`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPFileMethod"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Which CWD command to use.

0

Result Returns "OK" on success.

Description

Pass a long that should have one of the following values. This option controls what method libcurl should use to reach a file on a FTP(S) server. The argument should be one of the following alternatives:

Default	0	default
Multi CWD	1	libcurl does a single CWD operation for each path part in the given URL. For deep hierarchies this means many commands. This is how RFC 1738 says it should be done. This is the default but the slowest behavior.
No CWD	2	libcurl does no CWD at all. libcurl will do SIZE, RETR, STOR etc and give a full path to the server for all these commands. This is the fastest behavior.
Single CWD	3	libcurl does one CWD with the full target directory and then operates on the file "normally" (like in the multicwd case). This is somewhat more standards compliant than 'nocwd' but without the full penalty of 'multicwd'.

See also [FTP_FILEMETHOD](#) option in CURL manual.

Examples

Use single CWD command:

```
MBS( "CURL.SetOptionFTPFileMethod"; $curl; 3 )
```

Created 18th August 2014, last changed 16th November 2017.

61.210 CURL.SetOptionFTPPort

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPPort"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The port string.

""

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF-8"

Result Returns "OK" on success.

Description

It will be used to get the IP address to use for the FTP PORT instruction. The PORT instruction tells the remote server to connect to our specified IP address. The string may be a plain IP address, a host name, a network interface name (under Unix) or just a '-' symbol to let the library use your system's default IP address. Default FTP operations are passive, and thus won't use PORT.

The address can be followed by a ':' to specify a port, optionally followed by a '-' to specify a port range. If the port specified is 0, the operating system will pick a free port. If a range is provided and all ports in the range are not available, libcurl will report `CURLE_FTP_PORT_FAILED` for the handle. Invalid port/range settings are ignored. IPv6 addresses followed by a port or portrange have to be in brackets. IPv6 addresses without port/range specifier can be in brackets.

Examples with specified ports:

```
eth0:0 192.168.1.2:32000-33000 curl.se:32123 [ ::1 ] :1234-4567
```

You disable PORT again and go back to using the passive version by setting this option to empty string.

See also `CURL.SetOptionPort`.

See also **FTPPORT** option in CURL manual.

Examples

Sets to use default port:

MBS("CURL.SetOptionFTPPort"; \$curl; "-")

- 61.328 CURL.SetOptionSSLCert 2232
- 61.365 CURL.SetOptionTimeOut 2282
- 61.379 CURL.SetOptionVerbose 2307

Created 18th August 2014, last changed 19th June 2019.

61.211 CURL.SetOptionFTPResponseTimeout

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPResponseTimeout"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The timeout value in seconds.

60

Result Returns "OK" on success.

Description

Sets timeout period (in seconds) on the amount of time that the server is allowed to take in order to generate a response message for a command before the session is considered hung.

While curl is waiting for a response, this value overrides `CURL.SetOptionTimeout`. It is recommended that if used in conjunction with `CURL.SetOptionTimeout`, you set `CURL.SetOptionFTPResponseTimeout` to a value smaller than `CURL.SetOptionTimeout`.

See also [FTP_RESPONSE_TIMEOUT](#) option in CURL manual.

See also

- 61.187 `CURL.SetOptionConnectionTimeout` 2037

Created 18th August 2014, last changed 18th August 2014.

61.212 `CURL.SetOptionFTPSSLAUTH`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPSSLAUTH"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Sets the SSL mode.

2

Result Returns "OK" on success.

Description

Pass a long using one of the values from below, to alter how libcurl issues "AUTH TLS" or "AUTH SSL" when FTP over SSL is activated (see `CURLOPT_USE_SSL`).

<code>CURLFTPAUTH_DEFAULT</code>	0	Allow libcurl to decide.
<code>CURLFTPAUTH_SSL</code>	1	Try "AUTH SSL" first, and only if that fails try "AUTH TLS".
<code>CURLFTPAUTH_TLS</code>	2	Try "AUTH TLS" first, and only if that fails try "AUTH SSL".

See also [FTPSSLAUTH](#) option in CURL manual.

See also

- 61.320 `CURL.SetOptionSASLAUTHZID` 2221
- 61.345 `CURL.SetOptionSocks5Auth` 2262

61.212. *CURL.SETOPTIONFTPSSLAUTH*

2077

Created 18th August 2014, last changed 18th August 2014.

61.213 CURL.SetOptionFTPSSLCCC

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPSSLCCC"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to use CCC command.

2

Result Returns "OK" on success.

Description

It shuts down the SSL/TLS layer after authenticating. The rest of the control channel communication will be unencrypted. This allows NAT routers to follow the FTP transaction. Pass a number using one of the values below. (Added in 7.16.1)

CURLFTPSSL_CCC_NONE	0	Don't attempt to use CCC.
CURLFTPSSL_CCC_PASSIVE	1	Do not initiate the shutdown, but wait for the server to do it. Do not send a reply.
CURLFTPSSL_CCC_ACTIVE	2	Initiate the shutdown and wait for a reply.

See also [FTP_SSL_CCC](#) option in CURL manual.

See also

- 61.210 CURL.SetOptionFTPSPort 2073
- 61.212 CURL.SetOptionFTPSSLAAuth 2076

Created 18th August 2014, last changed 18th August 2014.

61.214 CURL.SetOptionFTPSkipPasvIP

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPSkipPasvIP"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to skip suggested IP.

1

Result Returns "OK" on success.

Description

Pass a long. If set to 1, it instructs CURL to not use the IP address the server suggests in its 227-response to CURL's PASV command when CURL connects the data connection. Instead libcurl will re-use the same IP address it already uses for the control connection. But it will use the port number from the 227-response. This option has no effect if PORT, EPRT or EPSV is used instead of PASV.

See also [FTP_SKIP_PASV_IP](#) option in CURL manual.

Created 18th August 2014, last changed 2nd August 2018.

61.215 `CURL.SetOptionFTPUseEPRT`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPUseEPRT"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to use EPRT command: 1 for EPRT, 0 for no EPRT.

1

Result Returns "OK" on success.

Description

If the value is 1, it tells curl to use the EPRT (and LPRT) command when doing active FTP downloads (which is enabled by `CURL.SetOptionFTPPort`). Using EPRT means that it will first attempt to use EPRT and then LPRT before using PORT, but if you pass zero to this option, it will not try using EPRT or LPRT, only plain PORT.

If the server is an IPv6 host, this option will have no effect.

See also [FTP_USE_EPRT](#) option in CURL manual.

See also

- 61.216 `CURL.SetOptionFTPUseEPSV` 2081
- 61.217 `CURL.SetOptionFTPUsePret` 2082

Created 18th August 2014, last changed 18th August 2014.

61.216 CURL.SetOptionFTPUseEPSV

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPUseEPSV"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to use EPSV command or PASV. Pass 1 for EPSV or 0 for PASV.

1

Result Returns "OK" on success.

Description

If the value is 1, it tells curl to use the EPSV command when doing passive FTP downloads (which it always does by default). Using EPSV means that it will first attempt to use EPSV before using PASV, but if you pass zero to this option, it will not try using EPSV, only plain PASV.

If the server is an IPv6 host, this option will have no effect as of 7.12.3.

See also [FTP_USE_EPSV](#) option in CURL manual.

See also

- 61.206 CURL.SetOptionFTPAccount 2067
- 61.212 CURL.SetOptionFTPSSLAAuth 2076
- 61.215 CURL.SetOptionFTPUseEPRT 2080
- 61.217 CURL.SetOptionFTPUsePret 2082

Created 18th August 2014, last changed 18th August 2014.

61.217 CURL.SetOptionFTPUsePret

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFTPUsePret"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to use PRET command: 1 for PRET, 0 for no PRET.

1

Result Returns "OK" on success.

Description

If the value is 1, it tells curl to send a PRET command before PASV (and EPSV). Certain FTP servers, mainly drftpd, require this non-standard command for directory listings as well as up and downloads in PASV mode. Has no effect when using the active FTP transfers mode.

See also [FTP_USE_PRET](#) option in CURL manual.

See also

- 61.308 CURL.SetOptionRTSPRequest 2207

Created 18th August 2014, last changed 18th August 2014.

61.218 CURL.SetOptionFailOnError

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFailOnError"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to fail on http errors.

0

Result Returns "OK" on success.

Description

A parameter set to 1 tells the library to fail silently if the HTTP code returned is equal to or larger than 400. The default action would be to return the page normally, ignoring that code.

This method is not fail-safe and there are occasions where non-successful response codes will slip through, especially when authentication is involved (response codes 401 and 407).

You might get some amounts of headers transferred before this situation is detected, like when a "100-continue" is received as a response to a POST/PUT and a 401 or 407 is received immediately afterwards. See also **FAILONERROR** option in CURL manual.

See also

- 61.219 CURL.SetOptionFileOnlyMode 2084
- 61.251 CURL.SetOptionMailFrom 2127

Created 18th August 2014, last changed 18th August 2014.

61.219 CURL.SetOptionFileOnlyMode

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.6	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFileOnlyMode"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to write data to files only and avoid storing data in memory.

1

Result Returns "OK" on success or error message.

Description

If you create file with CURL.CreateOutputFile you may want to have data only in file and avoid filling memory with data for the result functions.

Do not call this method while a transfer is running.

Examples

Write data only to file:

```
MBS( "CURL.SetOptionFileOnlyMode"; $curl; 1 )
MBS( "CURL.CreateOutputFile"; $curl; "/tmp/download.dat" )
```

Created 18th August 2014, last changed 18th August 2014.

61.220 CURL.SetOptionFileTime

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFileTime"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to query file time.

1

Result Returns "OK" on success.

Description

Pass a number. If it is 1, libcurl will attempt to get the modification date of the remote document in this operation. This requires that the remote server sends the time or replies to a time querying command. The `CURL.GetFileTime` function can be used after a transfer to extract the received time (if any).

See also [FILETIME](#) option in CURL manual.

61.221 `CURL.SetOptionFollowLocation`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFollowLocation"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to follow locations.

1

Result Returns "OK" on success.

Description

A parameter set to 1 tells the library to follow any `Location:` header that the server sends as part of an HTTP header.

This means that the library will re-send the same request on the new location and follow new `Location:` headers all the way until no more such headers are returned. `CURL.SetOptionMaxRedirs` can be used to limit the number of redirects libcurl will follow.

CURL can limit what protocols it will automatically follow. The accepted protocols are set with `CURL.SetOptionRedirProtocols` and it excludes the `FILE` protocol by default.

See also [FOLLOWLOCATION](#) option in CURL manual.

Examples

Allow up to three redirects:

```
Set Variable [ $result; Value: MBS("CURL.SetOptionFollowLocation"; $curl; 1) ]
```

```
Set Variable [ $result; Value: MBS("CURL.SetOptionMaxRedirs"; $curl; 3) ]
```

See also

Created 18th August 2014, last changed 12nd May 2016.

61.222 CURL.SetOptionForbidReuse

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionForbidReuse"; curl; Value)

(old name: CURL.SetOptionForbitReuse)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to disallow reusing connections.

0

Result Returns "OK" on success.

Description

Set to 1 to make the next transfer explicitly close the connection when done. Normally, libcurl keeps all connections alive when done with one transfer in case a succeeding one follows that can re-use them. This option should be used with caution and only if you understand what it does. Set to 0 to have libcurl keep the connection open for possible later re-use (default behavior).

see also `CURL.SetOptionFreshConnect`.

See also [FORBID_REUSE](#) option in CURL manual.

Examples

Forbit reusing connection:

```
MBS( "CURL.SetOptionForbitReuse"; $curl; 1 )
```

Forbit reuse and make fresh connection:

```
Set Variable [ $EmailID; Value: MBS( "CURL.SetOptionForbitReuse"; $curl; 1 ) ]
```

```
Set Variable [ $EmailID; Value: MBS( "CURL.SetOptionFreshConnect"; $curl; 1 ) ]
```

See also

- 61.223 `CURL.SetOptionFreshConnect`

2089

Created 18th August 2014, last changed 20th April 2018.

61.223 CURL.SetOptionFreshConnect

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionFreshConnect"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to not reuse old connection for next transfer.

0

Result Returns "OK" on success.

Description

Set to 1 to make the next transfer use a new (fresh) connection by force. If the connection cache is full before this connection, one of the existing connections will be closed as according to the selected or default policy. This option should be used with caution and only if you understand what it does. Set this to 0 to have libcurl attempt re-using an existing connection (default behavior).

see also [CURL.SetOptionForbidReuse](#).

See also [FRESH_CONNECT](#) option in CURL manual.

Examples

Request a fresh connection:

```
MBS( "CURL.SetOptionFreshConnect"; $curl; 1 )
```

Forbid reuse and make fresh connection:

```
Set Variable [ $EmailID; Value: MBS( "CURL.SetOptionForbidReuse"; $curl; 1 ) ]
```

```
Set Variable [ $EmailID; Value: MBS( "CURL.SetOptionFreshConnect"; $curl; 1 ) ]
```

61.224 `CURL.SetOptionGSSAPIDelegation`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionGSSAPIDelegation"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

See also [GSSAPI_DELEGATION](#) option in CURL manual.

Created 15th April 2018, last changed 16th April 2018.

61.225 CURL.SetOptionGet

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionGet"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to do a GET transfer.

1

Result Returns "OK" on success.

Description

Pass a number. If the number is 1, this forces the HTTP request to get back to GET. Usable if a POST, HEAD, PUT, or a custom request has been used previously using the same curl handle.

When setting value to 1, it will automatically set `CURL.SetOptionNoBody` to 0.

If you need POST, please use `CURL.SetOptionPost`. If you need DELETE, PATCH or others, please use `CURL.SetOptionCustomRequest` function.

Examples

Turns get on:

MBS("CURL.SetOptionGet"; \$curl; 1)

61.226 CURL.SetOptionHAProxyProtocol

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHAProxyProtocol"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new setting, 1 or 0

1

Result Returns OK or error.

Description

A value 1 tells the library to send an HAProxy PROXY protocol header at beginning of the connection. The default action is not to send this header.

This option is primarily useful when sending test requests to a service that expects this header.

Most applications do not need this option.

Default 0, do not send HAProxy PROXY protocol header.

See also [HAPROXYPROTOCOL](#) option in CURL manual.

61.227 `CURL.SetOptionHTTP200Aliases`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHTTP200Aliases"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

List of aliases.

"ICY 200 OK"

Result Returns "OK" on success.

Description

Some servers respond with a custom header response line. For example, IceCast servers respond with "ICY 200 OK". By including this string in your list of aliases, the response will be treated as a valid HTTP header line such as "HTTP/1.0 200 OK".

The alias itself is not parsed for any version strings. Before libcurl 7.16.3, Libcurl used the value set by option `CURL.SetOptionHTTPVersion`, but starting with 7.16.3 the protocol is assumed to match HTTP 1.0 when an alias matched.

This option takes a list of items. So this function takes a variable number of arguments. If you call function with 2 parameters, you set an empty list. If you call it with 5 parameters, you set a list with 3 values. See also [HTTP200ALIASES](#) option in CURL manual.

Examples

Call with three parameters:

```
MBS( "CURL.SetOptionHTTP200Aliases"; handle; $value1; $value2; $value3 )
```

See also

- 61.80 `CURL.GetOptionHTTP200Aliases` 1873

Created 18th August 2014, last changed 18th August 2014.

61.228 CURL.SetOptionHTTPAuth

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHTTPAuth"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Which http authentication to use.

15

Result Returns "OK" on success.

Description

Pass a number as parameter, which is set to a bitmask, to tell libcurl which authentication method(s) you want it to use. The available bits are listed below. If more than one bit is set, libcurl will first query the site to see which authentication methods it supports and then pick the best one you allow it to use. For some methods, this will induce an extra network round-trip. Set the actual name and password with the CURL.SetOptionUsername and the CURL.SetOptionPassword options.

See also [HTTPAUTH](#) option in CURL manual.

Examples

Request GSS-Negotiate:

MBS("CURL.SetOptionHTTPAuth"; \$curl; 4)

Use BASIC or Digest authorization:

MBS("CURL.SetOptionHTTPAuth"; \$curl; 1+2+16)

See also

- 61.101 CURL.GetProxyAuthAvail 1894
- 61.210 CURL.SetOptionFTPPort 2073
- 61.212 CURL.SetOptionFTPSSLAuth 2076
- 61.230 CURL.SetOptionHTTPHeader 2098
- 61.250 CURL.SetOptionMailAuth 2125

CURLAUTH_BASIC	1	HTTP Basic authentication. This is the default choice, and the only method that is in wide-spread use and supported virtually everywhere. This sends the user name and password over the network in plain text, easily captured by others.
CURLAUTH_DIGEST	2	HTTP Digest authentication. Digest authentication is defined in RFC 2617 and is a more secure way to do authentication over public networks than the regular old-fashioned Basic method.
CURLAUTH_DIGEST_IE	16	HTTP Digest authentication with an IE flavor. Digest authentication is defined in RFC 2617 and is a more secure way to do authentication over public networks than the regular old-fashioned Basic method. The IE flavor is simply that libcurl will use a special "quirk" that IE is known to have used before version 7 and that some servers require the client to use. (This define was added in 7.19.3)
CURLAUTH_GSSNEGOTIATE	4	HTTP GSS-Negotiate authentication. The GSS-Negotiate (also known as plain "Negotiate") method was designed by Microsoft and is used in their web applications. It is primarily meant as a support for Kerberos5 authentication but may also be used along with other authentication methods. For more information see IETF draft draft-brezak-spnego-http-04.txt. You need to build libcurl with a suitable GSS-API library for this to work.
CURLAUTH_NTLM	8	HTTP NTLM authentication. A proprietary protocol invented and used by Microsoft. It uses a challenge-response and hash concept similar to Digest, to prevent the password from being eavesdropped. You need to build libcurl with OpenSSL support for this option to work, or build libcurl on Windows.
CURLAUTH_ANY	15	This is a convenience macro that sets all bits and thus makes libcurl pick any it finds suitable. libcurl will automatically select the one it finds most secure.
CURLAUTH_ANYSAFE	14	This is a convenience macro that sets all bits except Basic and thus makes libcurl pick any it finds suitable. libcurl will automatically select the one it finds most secure.

61.229 CURL.SetOptionHTTPContentDecoding

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHTTPContentDecoding"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to do content decoding.

1

Result Returns "OK" on success.

Description

If set to zero, content decoding will be disabled. If set to 1 it is enabled. Libcurl has no default content decoding but requires you to use `CURLOPT_ENCODING` for that.

See also [HTTP_CONTENT_DECODING](#) option in CURL manual.

See also

- 61.232 `CURL.SetOptionHTTPTransferDecoding`

2103

Created 18th August 2014, last changed 18th August 2014.

61.230 `CURL.SetOptionHTTPHeader`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHTTPHeader"; curl; Values)

Parameters

curl

The CURL session handle.

\$curl

Values

Header values

"Content-Type: text/xml"

Result Returns "OK" on success.

Description

Pass a list of HTTP headers to pass to the server in your HTTP request. If you add a header that is otherwise generated and used by libcurl internally, your added one will be used instead. If you add a header with no content as in 'Accept:' (no data on the right side of the colon), the internally used header will get disabled. Thus, using this option you can add new headers, replace internal headers and remove internal headers. To add a header with no content, make the content be two quotes: "". The headers included in the linked list must not be CRLF-terminated, because curl adds CRLF after each header item. Failure to comply with this will result in strange bugs because the server will most likely ignore part of the headers you specified.

The first line in a request (containing the method, usually a GET or POST) is not a header and cannot be replaced using this option. Only the lines following the request-line are headers. Adding this method line in this list of headers will only cause your request to send an invalid header.

Pass a no parameters to this to reset back to no custom headers.

The most commonly replaced headers have "shortcuts" in the options `CURL.SetOptionCookie`, `CURL.SetOptionUserAgent` and `CURL.SetOptionReferer`.

This option takes a list of items. So this function takes a variable number of arguments. If you call function with 2 parameters, you set an empty list. If you call it with 5 parameters, you set a list with 3 values. See also [HTTPHEADER](#) option in CURL manual.

Examples

Set text/xml content type:

```
MBS( "CURL.SetOptionHTTPHeader"; $curl; "Content-Type: text/xml" )
```

Set two custom headers:

```
MBS( "CURL.SetOptionHTTPHeader"; $curl; "MyHeader1: hello"; "MyHeader2: world" )
```

Call with three parameters:

```
MBS( "CURL.SetOptionHTTPHeader"; handle; $value1; $value2; $value3 )
```

For SOAP, set content type and disable Expect header:

```
MBS("CURL.SetOptionHTTPHeader"; $curl; "Expect:"; "Content-Type: text/xml")
```

Set content type including a soap action:

```
MBS( "CURL.SetOptionHTTPHeader"; $curl; "Content-Type: application/soap+xml;charset=UTF-8;action=\urn:sap-com:document:sap:soap:functions:mc-style:ZMF_WS_00:ZmfWs00Request\" )
```

Request no cached copy:

```
MBS("CURL.SetOptionHTTPHeader"; $curl; "Cache-Control: no-cache")
```

Set content type for URL encoded form data:

```
MBS( "CURL.SetOptionHTTPHeader"; $curl; "Content-Type: application/x-www-form-urlencoded" )
```

Using a bearer for a webservice:

```
MBS( "CURL.SetOptionHTTPHeader"; $curl; "Authorization: Bearer a92eabb9-76f9-42ee-b280-bcd15cb2e9db";
"Content-Type: application/json")
```

Set SOAP Action and Content-Type for webservice:

```
MBS("CURL.SetOptionHTTPHeader"; $curl;
"Content-Type: text/xml;charset=\utf-8\";
"SOAPAction: \" & $SoapRequestName & \"\")
```

Query current account for Dropbox:

```
# Start new session
Set Variable [ $curl ; Value: MBS("CURL.New") ]
# Set URL to load (HTTP, HTTPS, FTP, FTPS, SFTP, etc.)
Set Variable [ $result ; Value: MBS("CURL.SetOptionURL"; $curl; "https://api.dropboxapi.com/2/users/get_current_account") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionCustomRequest"; $curl; "POST") ]
Set Variable [ $result ; Value: MBS("CURL.SetOptionHTTPHeader"; $curl; "Accept: */*"; "Authorization: Bearer xxx"; "Cache-Control: no-cache"; "accept-encoding: gzip, deflate"; "cache-control: no-cache"; "content-length:") ]
```

```

# RUN now
Set Field [ CURL Test::Result ; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ CURL Test::Text ; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::debug ; MBS("CURL.GetDebugAsText"; $curl) ]
# Cleanup
Set Variable [ $result ; Value: MBS("CURL.Cleanup"; $curl) ]

```

Created 18th August 2014, last changed 12nd September 2019.

61.231 `CURL.SetOptionHTTPProxyTunnel`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("`CURL.SetOptionHTTPProxyTunnel`"; `curl`; Value)

Parameters

`curl`

The CURL session handle.

`$curl`

Value

Whether to tunnel or not. (1 to tunnel, 0 to not tunnel)

1

Result Returns "OK" on success.

Description

There is a big difference between using a proxy and to tunnel through it. If you don't know what this means, you probably don't want this tunneling option.

See also [HTTPPROXYTUNNEL](#) option in CURL manual.

See also

- 61.278 `CURL.SetOptionProxy`

2171

Created 18th August 2014, last changed 18th August 2014.

61.232 CURL.SetOptionHTTPTransferDecoding

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHTTPTransferDecoding"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to decode.

1

Result Returns "OK" on success.

Description

If set to zero, transfer decoding will be disabled, if set to 1 it is enabled (default). libcurl does chunked transfer decoding by default unless this option is set to zero.

See also [HTTP_TRANSFER_DECODING](#) option in CURL manual.

See also

61.233 `CURL.SetOptionHTTPVersion`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHTTPVersion"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Sets the HTTP Version.

2

Result Returns "OK" on success.

Description

This is not sensible to do unless you have a good reason.

<code>CURL_HTTP_VERSION_NONE</code>	0	We don't care about what version the library uses. libcurl will use whatever it thinks fit.
<code>CURL_HTTP_VERSION_1_0</code>	1	Enforce HTTP 1.0 requests.
<code>CURL_HTTP_VERSION_1_1</code>	2	Enforce HTTP 1.1 requests.
<code>CURL_HTTP_VERSION_2_0</code>	3	please use HTTP 2 in the request
<code>CURL_HTTP_VERSION_2TLS</code>	4	use version 2 for HTTPS, version 1.1 for HTTP
<code>CURL_HTTP_VERSION_2_PRIOR_KNOWLEDGE</code>	5	please use HTTP 2 without HTTP/1.1 Upgrade

See also [HTTP_VERSION](#) option in CURL manual.

61.234 CURL.SetOptionHappyEyeballsTimeOutMS

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHappyEyeballsTimeOutMS"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Head start in milliseconds to give happy eyeballs.

See also [HAPPY_EYEBALLS_TIMEOUT_MS](#) option in CURL manual.

Created 15th April 2018, last changed 16th April 2018.

61.235 `CURL.SetOptionHeader`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionHeader"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

0 to disable or 1 to enable

1

Result Returns "OK" on success.

Description

A parameter set to 1 tells curl to include the header in the body output.

This is only relevant for protocols that actually have headers preceding the data (like HTTP).

For HTTP headers, please use `CURL.SetOptionHTTPHeader` function.

See also [HEADER](#) option in CURL manual.

61.237 CURL.SetOptionIPResolve

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionIPResolve"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

Whether to use IPv4 and/or IPv6.

2

Result Returns "OK" on success.

Description

This is only interesting when using host names that resolve addresses using more than one version of IP. The allowed values are:

IP Resolve Default	0	Default, resolves addresses to all IP versions that your system allows.
IP Resolve v4	1	Resolve to IPv4 addresses.
IP Resolve v6	2	Resolve to IPv6 addresses.

See also [IPRESOLVE](#) option in CURL manual.

Created 18th August 2014, last changed 25th November 2017.

61.238 CURL.SetOptionIgnoreContentLength

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionIgnoreContentLength"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to ignore content length. 1 to ignore and 0 to not ignore.

1

Result Returns "OK" on success.

Description

This is useful for Apache 1.x (and similar servers) which will report incorrect content length for files over 2 gigabytes. If this option is used, curl will not be able to accurately report progress, and will simply stop the download when the server ends the connection.

See also [IGNORE_CONTENT_LENGTH](#) option in CURL manual.

Created 18th August 2014, last changed 18th August 2014.

61.239 `CURL.SetOptionInFileSize`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionInFileSize"; curl; Value)

(old name: `CURL.SetOptionInFileLarge`)

Parameters

curl

The CURL session handle.

`$curl`

Value

The input size.

1234

Result Returns "OK" on success.

Description

When uploading a file to a remote site, this option should be used to tell libcurl what the expected size of the infile is. This value should be passed as a long. See also `CURL.SetOptionInFileLarge`.

For uploading using SCP, this option is mandatory.

When sending emails using SMTP, this command can be used to specify the optional SIZE parameter for the MAIL FROM command.

This option does not limit how much data libcurl will actually send, as that is controlled entirely by what the input data.

Our `CURL.SetInputText` and other input functions also set the file size.

See also [INFILESIZE](#) option in CURL manual.

Examples

Sets size of input:

MBS("CURL.SetOptionInFileSize"; `$curl`; `$size`)

See also

- 61.163 `CURL.SetInputText` 2002

- 61.220 `CURL.SetOptionFileTime` 2085

<i>61.239. CURL.SETOPTIONINFILESIZE</i>	2111
• 61.255 CURL.SetOptionMaxFileSize	2131
• 61.271 CURL.SetOptionPostFieldSize	2157

Created 18th August 2014, last changed 8th December 2016.

61.240 CURL.SetOptionInterface

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionInterface"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

Interface name.

en0

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns "OK" on success.

Description

The name can be an interface name, an IP address, or a host name.

See also **INTERFACE** option in CURL manual.

See also

Created 18th August 2014, last changed 5th July 2015.

61.241 CURL.SetOptionIssuerCert

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionIssuerCert"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The CA certificate file path.

"/tmp/cert.pem"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the `CURL.SetOptionSSLVerifyPeer` option. Otherwise, the result of the check is not considered as failure.

A specific error code (`CURLE_SSL_ISSUER_ERROR`) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (`CURL.SetOptionSSLVerifyPeer` has to be set too for the check to fail).

Starting with version 8.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

61.242 CURL.SetOptionKRBLevel

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionKRBLevel"; curl; Value { ; Encoding })

(old name: CURL.SetOptionKRB4Level)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new security level.

"safe"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

This also enables kerberos awareness. This is a string, 'clear', 'safe', 'confidential' or 'private'. If the string is set but doesn't match one of these, 'private' will be used. Set the string to empty value to disable kerberos support for FTP.

See also [KRBLEVEL](#) option in CURL manual.

61.243 **CURL.SetOptionKeepSendingOnError**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionKeepSendingOnError"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Continue to send data if the server responds early with an HTTP status code ≥ 300 .

See also [KEEP_SENDING_ON_ERROR](#) option in CURL manual.

Created 15th April 2018, last changed 28th November 2019.

61.244 CURL.SetOptionKeyPassword

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionKeyPassword"; curl; Value { ; Encoding })

(old name: CURL.SetOptionSSLCertPassword) (old name: CURL.SetOptionSSLKeyPassword)

Parameters**curl**

The CURL session handle.

\$curl

Value

The password text.

"hello"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Pass a string as parameter. It will be used as the password required to use the CURL.SetOptionSSLKey private key. You never needed a pass phrase to load a certificate but you need one to load your private key. See also **KEYPASSWORD** option in CURL manual.

Examples

Set a client SSL certificate:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionSSLCert"; $curl; "/some/certfile.pem") ]
```

```
Set Variable [ $r; Value:MBS("CURL.SetOptionSSLCertType"; $curl; "PEM") ]
```

```
Set Variable [ $r; Value:MBS("CURL.SetOptionKeyPassword"; $curl; "secret") ]
```

61.245 CURL.SetOptionLocalPort

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionLocalPort"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The port number (1-65535)

8000

Result Returns "OK" on success.

Description

This can be used in combination with `CURL.SetOptionInterface` and you are recommended to use `CURL.SetOptionLocalPortRange` as well when this is set. Valid port numbers are 1 - 65535.

Local ports <1024 usually need admin/root permissions to be used.

To set port to connect to, please use `CURL.SetOptionPort` instead.

See also [LOCALPORT](#) option in CURL manual.

See also

- 61.210 `CURL.SetOptionFTPPort` 2073

- 61.269 `CURL.SetOptionPort` 2151
- 61.287 `CURL.SetOptionProxyPort` 2181

Created 18th August 2014, last changed 8th February 2019.

61.246 CURL.SetOptionLocalPortRange

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionLocalPortRange"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The local port number attempts.

1

Result Returns "OK" on success.

Description

It starts with the given `CURL.SetOptionLocalPort` and adds one to the number for each retry. Setting this to 1 or below will make libcurl do only one try for the exact port number. Port numbers by nature are scarce resources that will be busy at times so setting this value to something too low might cause unnecessary connection setup failures.

See also [LOCALPORTRANGE](#) option in CURL manual.

See also

- 61.245 `CURL.SetOptionLocalPort`

2119

Created 18th August 2014, last changed 18th August 2014.

61.247 CURL.SetOptionLoginOptions

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	5.4	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionLoginOptions"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The options string.

""

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns OK or error.

Description

For more information about the login options please see RFC 2384, RFC5092 and IETF draft draft-earhart-url-smtp-00.txt

OptionLoginOptions can be used to set protocol specific login options, such as the preferred authentication mechanism via "AUTH=NTLM" or "AUTH=*", and should be used in conjunction with the CURL.SetOptionUserName option.

Only IMAP, POP3 and SMTP support login options.

See also [LOGIN_OPTIONS](#) option in CURL manual.

Examples

Use plain authentication:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionLoginOptions"; $curl; "AUTH=PLAIN") ]
```

Use CRAM MD5 authentication:

```
Set Variable [ $r; Value:MBS("CURL.SetOptionLoginOptions"; $curl; "AUTH=CRAM-MD5") ]
```

Use LOGIN with username and password:

```
MBS("CURL.SetOptionLoginOptions"; $curl; "AUTH=LOGIN")
```

61.248 CURL.SetOptionLowSpeedLimit

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionLowSpeedLimit"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The low speed limit in bytes second.

1000

Result Returns "OK" on success.

Description

It contains the transfer speed in bytes per second that the transfer should be below during CURL.SetOptionLowSpeedTime seconds for the library to consider it too slow and abort.

See also [LOW_SPEED_LIMIT](#) option in CURL manual.

See also

- 61.249 CURL.SetOptionLowSpeedTime

2124

Created 18th August 2014, last changed 18th August 2014.

61.249 `CURL.SetOptionLowSpeedTime`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionLowSpeedTime"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The slow time.

100

Result Returns "OK" on success.

Description

Pass time in seconds that the transfer should be below the `CURL.SetOptionLowSpeedLimit` for the library to consider it too slow and abort.

See also [LOW_SPEED_TIME](#) option in CURL manual.

See also

- 61.248 `CURL.SetOptionLowSpeedLimit`

2123

Created 18th August 2014, last changed 18th August 2014.

61.250 CURL.SetOptionMailAuth

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.9	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMailAuth"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The new options.

""

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

This string will be used to specify the authentication address (identity) of a submitted message that is being relayed to another server.

This optional parameter allows co-operating agents in a trusted environment to communicate the authentication of individual messages and should only be used by the application program, using libcurl, if the application is itself a mail server acting in such an environment. If the application is operating as such and the AUTH address is not known or is invalid, then an empty string should be used for this parameter.

Unlike `CURL.SetOptionMailRecipients`, the address should not be specified within a pair of angled brackets (<>). However, if an empty string is used then a pair of brackets will be sent by libcurl as required by RFC 2554.

See also [MAIL_AUTH](#) option in CURL manual.

Examples

Set mail auth address:

MBS("CURL.SetOptionMailAuth"; \$curl; "<secret@cave>")

See also

- 61.212 `CURL.SetOptionFTPSSLAAuth` 2076
- 61.228 `CURL.SetOptionHTTPAAuth` 2095

- 61.266 `CURL.SetOptionPathAsIs` 2148
- 61.279 `CURL.SetOptionProxyAuth` 2173
- 61.345 `CURL.SetOptionSocks5Auth` 2262
- 61.365 `CURL.SetOptionTimeOut` 2282

Created 18th August 2014, last changed 8th February 2018.

61.251 CURL.SetOptionMailFrom

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMailFrom"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The from address.

"someone@macsw.de"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

It will be used to specify the sender address in a mail when sending an SMTP mail with libcurl.

An originator email address in SMTP lingo is specified within angle brackets (<>) which libcurl will not add for you before version 7.21.4. Failing to provide such brackets may cause the server to reject your mail. See also [MAIL_FROM](#) option in CURL manual.

61.252 CURL.SetOptionMailRecipients

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMailRecipients"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

First email address.

"someone@macsw.de"

Result Returns "OK" on success.

Description

Pass a list of recipients to pass to the server in your SMTP mail request. For passing several recipients, simply add more parameters to the function call.

Each recipient in SMTP lingo is specified with angle brackets (<>), but should you not use an angle bracket as first letter libcurl will assume you provide a single email address only and enclose that with angle brackets for you.

This option takes a list of items. So this function takes a variable number of arguments. If you call function with 2 parameters, you set an empty list. If you call it with 5 parameters, you set a list with 3 values. See also [MAIL_RCPT](#) option in CURL manual.

Examples

Set three recipients:

```
MBS( "CURL.SetOptionMailRecipients"; $curl; $email1; $email2; $email3 )
```

See also

- 61.82 CURL.GetOptionMailRecipients 1875

- [MBS FileMaker Plugin, version 9.3pr1](#)

Created 22nd May 2019, last changed 23th May 2019.

61.254 `CURL.SetOptionMaxConnects`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMaxConnects"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The new limit.

5

Result Returns "OK" on success.

Description

The set amount will be the maximum amount of simultaneously open connections that libcurl may cache in this easy handle. Default is 5, and there isn't much point in changing this value unless you are perfectly aware of how this works and changes libcurl's behaviour. This concerns connections using any of the protocols that support persistent connections.

When reaching the maximum limit, curl closes the oldest one in the cache to prevent increasing the number of open connections.

If you already have performed transfers with this curl handle, setting a smaller MaxConnects than before may cause open connections to get closed unnecessarily.

See also [MAXCONNECTS](#) option in CURL manual.

See also

Created 18th August 2014, last changed 18th August 2014.

61.255 CURL.SetOptionMaxFileSize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMaxFileSize"; curl; Value)

(old name: CURL.SetOptionMaxFileSizeLarge)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new maximum file size.

1000000

Result Returns "OK" on success.

Description

Pass a number as parameter. This allows you to specify the maximum size (in bytes) of a file to download. If the file requested is larger than this value, the transfer will not start and `CURLE_FILESIZE_EXCEEDED` will be returned.

The file size is not always known prior to download, and for such files this option has no effect even if the file transfer ends up being larger than this given limit. This concerns both FTP and HTTP transfers.

See also [MAXFILESIZE](#) option in CURL manual.

See also

Created 18th August 2014, last changed 18th April 2016.

61.256 `CURL.SetOptionMaxRecvSpeed`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMaxRecvSpeed"; curl; Value)

(old name: `CURL.SetOptionMaxRecvSpeedLarge`)

Parameters

curl

The CURL session handle.

\$curl

Value

The maximum download speed in bytes per second.

50000

Result Returns "OK" on success.

Description

If a download exceeds this speed (counted in bytes per second) on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed.

See also [MAX_RECV_SPEED](#) option in CURL manual.

See also

- 61.255 `CURL.SetOptionMaxFileSize` 2131

Created 18th August 2014, last changed 20th April 2018.

61.257 CURL.SetOptionMaxRedirs

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMaxRedirs"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Maximum number of redirects.

-1

Result Returns "OK" on success.

Description

If that many redirections have been followed, the next redirect will cause an error (`CURLE_TOO_MANY_REDIRECTS`). This option only makes sense if the `CURL.SetOptionFollowLocation` is used at the same time.

Added in 7.15.1: Setting the limit to 0 will make CURL refuse any redirect. Set it to -1 for an infinite number of redirects (which is the default)

See also [MAXREDIRS](#) option in CURL manual.

Examples

Allow up to three redirects:

```
Set Variable [ $result; Value: MBS("CURL.SetOptionFollowLocation"; $curl; 1) ]
```

```
Set Variable [ $result; Value: MBS("CURL.SetOptionMaxRedirs"; $curl; 3) ]
```

61.258 CURL.SetOptionMaxSendSpeed

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionMaxSendSpeed"; curl; Value)

(old name: CURL.SetOptionMaxSendSpeedLarge)

Parameters**curl**

The CURL session handle.

\$curl

Value

Maximum sending speed in bytes per second.

50000

Result Returns "OK" on success.

Description

If an upload exceeds this speed (counted in bytes per second) on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed.

Useful if you have a limited pipe and you'd like your transfer not to use your entire bandwidth.

Slowing down the transfer speed is also useful for lowering CPU consumption during transfers.

See also [MAX_SEND_SPEED](#) option in CURL manual.

61.259 `CURL.SetOptionNETRCFile`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionNETRCFile"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The file path.

\$path

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Pass a text string containing the full path name to the file you want libcurl to use as .netrc file. If this option is omitted, and `CURL.SetOptionNetRC` is set, libcurl will attempt to find a .netrc file in the current user's home directory.

Starting with version 8.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

See also [NETRC_FILE](#) option in CURL manual.

61.260 CURL.SetOptionNetRC

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionNetRC"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The netrc preference.

0

Result Returns "OK" on success.

Description

This parameter controls the preference of libcurl between using user names and passwords from your ~/.netrc file, relative to user names and passwords in the URL supplied with CURLOPT_URL.

libcurl uses a user name (and supplied or prompted password) supplied with CURL.SetOptionUsername in preference to any of the options controlled by this parameter.

Pass a long, set to one of the values described below.

CURL_NETRC_OPTIONAL 1 The use of your ~/.netrc file is optional, and information in the URL is to be preferred. The file will be scanned for the host and user name (to find the password only) or for the host only, to find the first user name and password after that machine, which ever information is not specified in the URL. Undefined values of the option will have this effect.
CURL_NETRC_IGNORED 0 The library will ignore the file and use only the information in the URL. This is the default.
CURL_NETRC_REQUIRED 2 This value tells the library that use of the file is required, to ignore the information in the URL, and to search the file for the host only.

Only machine name, user name and password are taken into account (init macros and similar things aren't supported).

libcurl does not verify that the file has the correct properties set (as the standard Unix ftp client does). It should only be readable by user.

See also **NETRC** option in CURL manual.

61.261 CURL.SetOptionNewDirectoryPerms

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionNewDirectoryPerms"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The permissions value. (octal value!)

7*8*8+5*8+5

Result Returns "OK" on success.

Description

Pass a number as a parameter, containing the value of the permissions that will be assigned to newly created directories on the remote server. The default value is 0755, but any valid value can be used. The only protocols that can use this are sftp://, scp://, and file://.

See also [NEW_DIRECTORY_PERMS](#) option in CURL manual.

See also

- 61.262 CURL.SetOptionNewFilePerms

2140

Created 18th August 2014, last changed 18th August 2014.

61.262 `CURL.SetOptionNewFilePerms`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionNewFilePerms"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The permissions value. (octal value!)

8*8*6+4+8+4

Result Returns "OK" on success.

Description

Pass a number as parameter, containing the value of the permissions that will be assigned to newly created files on the remote server. The default value is 0644, but any valid value can be used. The only protocols that can use this are sftp://, scp://, and file://.

Values are specified in octal, so octal 755 is decimal 493. Octal 644 is 420 (6*8*8+4*8+4).

See also [NEW_FILE_PERMS](#) option in CURL manual.

- 61.261 `CURL.SetOptionNewDirectoryPerms`

2139

Created 18th August 2014, last changed 18th August 2014.

61.263 CURL.SetOptionNoBody

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionNoBody"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether to ignore body.

1

Result Returns "OK" on success.

Description

Set to 1 tells the library to not include the body-part in the output. This is only relevant for protocols that have separate header and body parts. On HTTP(S) servers, this will make libcurl do a HEAD request.

To change request to GET, you should use `CURL.SetOptionGet`. Change request to POST with `CURL.SetOptionPost` etc.

See also **NOBODY** option in CURL manual.

Examples

Get only the headers:

MBS("CURL.SetOptionNoBody"; \$curl; 1)

61.264 CURL.SetOptionNoProxy

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionNoProxy"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The list of hosts which use no proxy.

"local.com,mbsplugins.com"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

This text should be a comma separated list of hosts which do not use a proxy, if one is specified.

The only wildcard is a single * character, which matches all hosts, and effectively disables the proxy. Each name in this list is matched as either a domain which contains the hostname, or the hostname itself. For example, local.com would match local.com, local.com:80, and www.local.com, but not www.notlocal.com.

See also **NOPROXY** option in CURL manual.

61.265 CURL.SetOptionPassword

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPassword"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The password text.

"test123"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

The CURL.SetOptionPassword option should be used in conjunction with the CURL.SetOptionUsername option.

See also **PASSWORD** option in CURL manual.

Examples

Set login credentials:

```
Set Variable [ $result ; Wert: MBS("CURL.SetOptionUserName"; $curl; Logins::Username) ]
Set Variable [ $result ; Wert: MBS("CURL.SetOptionPassword"; $curl; Logins::Password) ]
```

Use netverify.com to check a driver license:

```
# Setup transfer
Set Variable [ $r; Value:MBS("Trace") ]
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://netverify.com/api/netverify/v2/fast-fill") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionVerbose"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUserName"; $curl; "25D63FB16966473DA2416454FD468BBD") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; "4356789038498914948018924658901622") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionVerbose"; $curl; 1) ]
```

```

Set Variable [ $result; Value:MBS("CURL.SetOptionHTTPHeader"; $curl; "Accept: application/json"; "Expect:") ]
Set Variable [ $metadata; Value:" { \"type\": \"DRIVING_LICENSE\", \"country\": \"USA\" } " ]
Set Variable [ $r; Value:MBS("CURL.FormAddKeyValue";$curl; "metadata"; $metadata) ]
Set Variable [ $r; Value:MBS("CURL.FormAddKeyContainerContentType";$curl; "backsideImage"; "test.jpg"; Donor Docs::DocPDF; "image/jpeg") ]
Set Variable [ $r; Value:MBS("CURL.FormFinish";$curl) ]
# Run transfer
Set Field [ Donor Docs::ResultCodePost; MBS("CURL.Perform"; $curl) ]
# Check result
Set Field [ Donor Docs::DebugTextPost; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value: MBS("CURL.GetResultAsText"; $curl) ]
Set Field [ Donor Docs::ResultTextPost; $result ]

```

Download file via SFTP to file on disk:

```

Set Variable [ $curl; Value:MBS("CURL.New") ]
# set download URL, e.g. sftp://monkeybreadsoftware.net/test.jpg
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; SFTP Download::URL ) ]
# build file path on disk and open output file
Set Variable [ $name; Value:GetValue(SFTP Download::FileName; 1) ]
Set Variable [ $path; Value:MBS( "Path.AddPathComponent"; SFTP Download::FolderPath; $name ) ]
Set Variable [ $r; Value:MBS("CURL.CreateOutputFile"; $curl; $path) ]
# login only via password
Set Variable [ $result; Value:MBS( "CURL.SetOptionSSHAuthTypes"; $curl; 2+8 ) ]
# set credentials
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; SFTP Download::UserName ) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; SFTP Download::Password ) ]
# run transfer
Set Field [ SFTP Download::ErrorCode; MBS("CURL.Perform"; $curl) ]
# check debug log for errors
Set Field [ SFTP Download::Debug; MBS("CURL.GetDebugAsText"; $curl) ]
# free CURL session
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]

```

61.266 **CURL.SetOptionPathAsIs**

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPathAsIs"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Do not squash dot-dot sequences if set to 1.

See also [PATH_AS_IS](#) option in CURL manual.

61.267 CURL.SetOptionPinnedPublicKey

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPinnedPublicKey"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

Native path to key file.

This option is used only if SSLVerifyPeer is true.

See also [PINNEDPUBLICKEY](#) option in CURL manual.

See also

61.269 CURL.SetOptionPort

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPort"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new port number.

8000

Result Returns "OK" on success.

Description

Specify what remote port number to connect to, instead of the one specified in the URL or the default port for the used protocol.

See also `CURL.SetOptionFTPPort`.

Protocols	Common Ports
http	80, 443 with SSL
ftp	20 and 21
sftp	22
smtp	25, 465 with SSL, 587
pop3	110, 995 with SSL
imap	143, 993 with TLS

See also **PORT** option in CURL manual.

Examples

Use Port 25 for smtp:

```
MBS( "CURL.SetOptionPort"; $curl; 25 )
# alternative 587 or with SSL 465.
```

Use Port 8080 for http:

```
MBS( "CURL.SetOptionPort"; $curl; 8080 )
```

61.270 CURL.SetOptionPost

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPost"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether this is a POST request.

1

Result Returns "OK" on success.

Description

A parameter set to 1 tells the library to do a regular HTTP post. This will also make the library use a "Content-Type: application/x-www-form-urlencoded" header. (This is by far the most commonly used POST method).

Use one of `CURL.SetOptionPostFields` options to specify what data to post and `CURL.SetOptionPostFieldSize` to set the data size.

Optionally, you can provide data to POST using the `CURL.SetInput*` functions but then you must make sure to not set `CURL.SetOptionPostFields` to anything but "". When providing data with a callback, you must transmit it using chunked transfer-encoding or you must set the size of the data with the `SetOptionPostFieldSize` or `CURL.SetOptionPostFieldSizeLarge` option. To enable chunked encoding, you simply pass in the appropriate Transfer-Encoding header.

You can override the default POST Content-Type: header by setting your own with `CURL.SetOptionHTTPHeader`.

Using POST with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with `CURL.SetOptionHTTPHeader` as usual.

If you use POST to a HTTP 1.1 server, you can send data without knowing the size before starting the POST if you use chunked encoding. You enable this by adding a header like "Transfer-Encoding: chunked" with `CURL.SetOptionHTTPHeader`. With HTTP 1.0 or without chunked transfer, you must specify the size in the request.

When setting `CURL.SetOptionPost` to 1, it will automatically set `CURL.SetOptionNoBody` to 0 (since

7.14.1).

If you issue a POST request and then want to make a HEAD or GET using the same re-used handle, you must explicitly set the new request type using `CURL.SetOptionNoBody` or `CURL.SetOptionGet` or similar.

For debugging, the website <https://www.posttestserver.com> is very useful. It allows you to see what is received on the other end for a post operation.

If you need GET, please use `CURL.SetOptionGet`. If you need DELETE, PATCH or others, please use `CURL.SetOptionCustomRequest` function.

See also **POST** option in CURL manual.

Examples

Enables POST option:

```
MBS( "CURL.SetOptionPost"; $curl; 1 )
```

Using Rosette web service:

```
# Start new CURL transfer
Set Variable [ $curl; Value:MBS("CURL.New") ]
# Set options like Verbose Debug Messages
Set Variable [ $result; Value:MBS("CURL.SetOptionVerbose"; $curl; 1) ]
# the url of webservice
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://api.rosette.com/rest/v1/morphology/parts-of-speech") ]
# the header info for tagging, API Key comes from a global field.
Set Variable [ $result; Value:MBS("CURL.SetOptionHTTPHeader"; $curl; "user_key: " & RosetteAPISettings::RosetteAPIKey; "Content-Type: application/json"; "Accept: application/json" ) ]
# We want a POST transfer:
Set Variable [ $result; Value:MBS("CURL.SetOptionPost"; $curl; 1 ) ]
# Build JSON using the plugin function to properly encode a string:
Set Variable [ $request; Value:" { \"content\": " & MBS("JSON.CreateString"; TextData::TextAsInput) & " } " ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; $request) ]
# show our JSON in a field for debugging:
Set Field [ TextData::CURLInput; $request ]
# Run transfer
Set Variable [ $result; Value:MBS("CURL.Perform"; $curl) ]
# Check result and debug messages
Set Field [ TextData::CurlDebug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Field [ TextData::CurlOutput; MBS("CURL.GetResultAsText"; $curl) ]
# Cleanup
Set Variable [ $r; Value:MBS("CURL.Cleanup"; $curl) ]
```

Charge with Stripe webservice:

```
# new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# use stripe charge API
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://api.stripe.com/v1/charges") ]
# set user name
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "sk_test_ your id here") ]
# make a post with given content:
Set Variable [ $result; Value:MBS("CURL.SetOptionPost"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; "amount=400& currency=usd& de-
scription=Charge% 20for% 20test@example.com& source [ object ] =card& source [ number ] =4242424242424242&
source [ exp_month ] =12& source [ exp_year ] =2017& source [ cvc ] =123" ) ]
# perform
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# now check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Run a generic POST request for REST or SOAP web service:

```
# new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# use stripe charge API
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://someURL/service") ]
# set user name and password if needed:
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "user name") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; "password") ]
# set some additional headers, which may include custom authorization and content types:
Set Variable [ $result; Value:MBS("CURL.SetOptionHTTPHeader"; $curl; "Authorization: Bearer a92eabb9-
76f9-42ee-b280-bcd15cb2e9db"; "Content-Type: application/json" ) ]
# make a post with given content:
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; $json ) ]
# perform
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# now check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.271 CURL.SetOptionPostFieldSize

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPostFieldSize"; curl; Value)

(old name: CURL.SetOptionPostFieldSizeLarge)

Parameters**curl**

The CURL session handle.

\$curl

Value

The post fields data size in bytes.

1234

Result Returns "OK" on success.

Description

If you want to post data to the server without letting libcurl do a string length() to measure the data size, this option must be used. When this option is used you can post fully binary data, which otherwise is likely to fail. If this size is set to -1, the library will use strlen() to get the size.

See also [POSTFIELDSIZE](#) option in CURL manual.

See also

- 61.239 CURL.SetOptionInFileSize 2110

- 61.270 CURL.SetOptionPost 2153
- 61.272 CURL.SetOptionPostFields 2158
- 61.274 CURL.SetOptionPostRedir 2164

Created 18th August 2014, last changed 18th July 2019.

61.272 CURL.SetOptionPostFields

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.SetOptionPostFields"; curl; Value { ; Encoding } )
```

Parameters

curl

The CURL session handle.

\$curl

Value

The post data.

””

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

”UTF8”

Result Returns ”OK” on success.

Description

Pass a text, which should be the full data to post in an HTTP POST operation.

The plugin sets the size for you. You can overwrite it with `CURL.SetOptionPostFieldSize` function.

If you plan to pass a form, maybe check functions like `CURL.FormAddKeyValue` instead of building post fields yourself.

You can use `CURL.SetOptionHTTPHeader` to set the content type and other headers.

Using this function is not recommended for more than a few hundred MB of text. If you need more, better stream the data with `CURL.OpenInputFile` from a file.

See also [COPYPOSTFIELDS](#) option in CURL manual.

Examples

Set post field with some XML for SOAP Webservice:

```
MBS("CURL.SetOptionPostFields"; $curl; "<xml>....</xml>"; "UTF-8")
```

Set post fields:

```
MBS("CURL.SetOptionPostFields"; $curl; "first=John& last=Smith"; "UTF-8")
```

Build form:

```
MBS( "CURL.FormAddKeyValue"; $curl; "login"; "testuser" )
MBS( "CURL.FormAddKeyValue"; $curl; "password"; "xxx" )
MBS( "CURL.FormFinish"; $curl )
```

Charge with Stripe webservice:

```
# new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# use stripe charge API
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://api.stripe.com/v1/charges") ]
# set user name
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "sk_test__ your id here") ]
# make a post with given content:
Set Variable [ $result; Value:MBS("CURL.SetOptionPost"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; "amount=400& currency=usd& description=Charge% 20for% 20test@example.com& source [ object ] =card& source [ number ] =4242424242424242& source [ exp_month ] =12& source [ exp_year ] =2017& source [ cvc ] =123" ) ]
# perform
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# now check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Run a generic POST request for REST or SOAP web service:

```
# new session
Set Variable [ $curl; Value:MBS("CURL.New") ]
# use stripe charge API
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "https://someURL/service") ]
# set user name and password if needed:
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; "user name") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; "password") ]
# set some additional headers, which may include custom authorization and content types:
Set Variable [ $result; Value:MBS( "CURL.SetOptionHTTPHeader"; $curl; "Authorization: Bearer a92eabb9-76f9-42ee-b280-bcd15cb2e9db"; "Content-Type: application/json" ) ]
# make a post with given content:
Set Variable [ $result; Value:MBS("CURL.SetOptionPostFields"; $curl; $json ) ]
# perform
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# now check result
Set Field [ CURL Test::Text; MBS("CURL.GetResultAsText"; $curl; "UTF8") ]
Set Field [ CURL Test::header; MBS("CURL.GetDebugAsText"; $curl) ]
# cleanup
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

Created 18th August 2014, last changed 22nd November 2019.

61.273 `CURL.SetOptionPostQuote`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.SetOptionPostQuote"; curl; Value )
```

Parameters

curl

The CURL session handle.

`$curl`

Value

The ftp commands.

””

Result Returns ”OK” on success.

Description

The commands will only be run if no error occurred. Disable this operation again by passing no value to this function.

This option takes a list of items. So this function takes a variable number of arguments. If you call function with 2 parameters, you set an empty list. If you call it with 5 parameters, you set a list with 3 values. If you want to do a ftp operation instead of download/upload/directory listing, please use `CURL.SetOptionQuote`.

See also `CURL.SetOptionQuote` and `CURL.SetOptionPreQuote`.

File names may be passed with quotes to include spaces in file names.

See also **POSTQUOTE** option in CURL manual.

Examples

Create folder:

```
MBS( "CURL.SetOptionPostQuote"; $curl; "MKD testfolder" )
```

Rename file using two FTP commands:

```
MBS( "CURL.SetOptionPostQuote" ; $curl ; "RNFR foo.txt"; "RNTO bar.txt" )
```

Delete file after upload:

```
MBS( "CURL.SetOptionPostQuote"; $curl; "DELE test.txt" )
```

Delete folder after upload:

MBS("CURL.SetOptionPostQuote"; \$curl; "RMD testfolder")

Set file permissions:

MBS("CURL.SetOptionPostQuote" ; \$curl ; "SITE CHMOD 777 testfile")

Call with three parameters:

MBS("CURL.SetOptionPostQuote"; handle; \$value1; \$value2; \$value3)

Rename file for SFTP commands:

MBS("CURL.SetOptionPostQuote" ; \$curl ; "rename \"old name.txt\" \"new name.txt\"")

Create folder with SFTP:

Set Variable [\$result ; Value: MBS("CURL.SetOptionPostQuote"; \$curl; "mkdir testPost")]

Created 18th August 2014, last changed 8th November 2017.

61.274 `CURL.SetOptionPostRedir`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPostRedir"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The new bitmask for redirections.

3

Result Returns "OK" on success.

Description

Pass a bitmask to control how libcurl acts on redirects after POSTs that get a 301 or 302 response back. A parameter with bit 0 set (value `CURL_REDIR_POST_301`) tells the library to respect RFC 2616/10.3.2 and not convert POST requests into GET requests when following a 301 redirection. Setting bit 1 (value `CURL_REDIR_POST_302`) makes libcurl maintain the request method after a 302 redirect. `CURL_REDIR_POST_ALL` is a convenience define that sets both bits.

The non-RFC behaviour is ubiquitous in web browsers, so the library does the conversion by default to maintain consistency. However, a server may require a POST to remain a POST after such a redirection. This option is meaningful only when setting `CURL.SetOptionFollowLocation`. (This option was known as `CURLOPT_POST301` up to 7.19.0 as it only supported the 301 way before then)

<code>CURL_REDIR_POST_301</code>	1
<code>CURL_REDIR_POST_302</code>	2
<code>CURL_REDIR_POST_ALL</code>	3

Created 15th April 2018, last changed 16th April 2018.

61.276 CURL.SetOptionPreQuote

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPreQuote"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The ftp commands.

""

Result Returns "OK" on success.

Description

Disable this operation again by passing no value to this function. Before version 7.15.6, if you also set `CURL.SetOptionNoBody` to 1, this option didn't work.

This option takes a list of items. So this function takes a variable number of arguments. If you call function with 2 parameters, you set an empty list. If you call it with 5 parameters, you set a list with 3 values.

See also `CURL.SetOptionQuote` and `CURL.SetOptionPostQuote`.

File names may be passed with quotes to include spaces in file names.

See also **PREQUOTE** option in CURL manual.

Examples

Create folder before upload:

```
MBS( "CURL.SetOptionPreQuote"; $curl; "MKD testfolder" )
```

Rename file before uploading using two FTP commands:

```
MBS( "CURL.SetOptionPreQuote" ; $curl ; "RNFR foo.txt"; "RNTO bar.txt" )
```

Delete file before upload:

```
MBS( "CURL.SetOptionPreQuote"; $curl; "DELE test.txt" )
```

Delete folder before upload:

```
MBS( "CURL.SetOptionPreQuote"; $curl; "RMD testfolder" )
```

Set file permissions:

```
MBS( "CURL.SetOptionPreQuote" ; $curl ; "SITE CHMOD 777 testfile")
```

Call with three parameters:

```
MBS( "CURL.SetOptionPreQuote"; handle; $value1; $value2; $value3 )
```

Created 18th August 2014, last changed 6th November 2017.

61.277 CURL.SetOptionProtocols

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProtocols"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The bitmask defining which protocols to use.

1

Result Returns "OK" on success.

Description

Pass a number that holds a bitmask of protocol values (See below). If used, this bitmask limits what protocols libcurl may use in the transfer. This allows us to have a plugin built to support a wide range of protocols but still limit specific transfers to only be allowed to use a subset of them. By default libcurl will accept all protocols it supports. See also [CURL.SetOptionRedirProtocols](#).

HTTP 1

HTTPS2

See also [PROTOCOLS](#) option in CURL manual.

61.278 CURL.SetOptionProxy

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

```
MBS( "CURL.SetOptionProxy"; curl; Value { ; Encoding } )
```

Parameters**curl**

The CURL session handle.

\$curl

Value

The proxy string

"http://cache.local.com/:8000"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"utf8"

Result Returns "OK" on success.

Description

The parameter should be a text string holding the host name or dotted IP address. To specify port number in this string, append : [port] to the end of the host name. The proxy string may be prefixed with [protocol] :// since any such prefix will be ignored. The proxy's port number may optionally be specified with the separate option. If not specified, libcurl will default to using port 1080 for proxies. see also `CURL.SetOptionProxyPort`.

When you tell the library to use an HTTP proxy, libcurl will transparently convert operations to HTTP even if you specify an FTP URL etc. This may have an impact on what other features of the library you can use, such as `CURL.SetOptionQuote` and similar FTP specifics that don't work unless you tunnel through the HTTP proxy. Such tunneling is activated with `CURL.SetOptionHTTPProxyTunnel`.

libcurl respects the environment variables `http_proxy`, `ftp_proxy`, `all_proxy` etc, if any of those are set. The `CURL.SetOptionProxy` option does however override any possibly set environment variables.

Setting the proxy string to "" (an empty string) will explicitly disable the use of a proxy, even if there is an environment variable set for it.

Since 7.14.1, the proxy host string given in environment variables can be specified the exact same way as the proxy can be set with `CURL.SetOptionProxy`, include protocol prefix (`http://`) and embedded user + password.

Since 7.21.7, the proxy string may be specified with a protocol:// prefix to specify alternative proxy protocols. Use socks4://, socks4a://, socks5:// or socks5h:// (the last one to enable socks5 and asking the proxy to do the resolving, also known as CURLPROXY_SOCKS5_HOSTNAME type) to request the specific SOCKS version to be used. No protocol specified, http:// and all others will be treated as HTTP proxies.

Setting the property and getting back OK does just mean that the plugin passed the value. It does not confirm that the proxy is working or used.

See also **PROXY** option in CURL manual.

Examples

Set a proxy:

```
MBS( "CURL.SetOptionProxy"; $curl; "http://cache.local.com/:8000")
```

61.279 CURL.SetOptionProxyAuth

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyAuth"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The bitmask of allowed authentication methods. 15

Result Returns "OK" on success.

Description

Pass a number as parameter, which is set to a bitmask, to tell libcurl which authentication method(s) you want it to use for your proxy authentication. If more than one bit is set, libcurl will first query the site to see what authentication methods it supports and then pick the best one you allow it to use. For some methods, this will induce an extra network round-trip. Set the actual name and password with the `CURL.SetOptionProxyUsername` option. The bitmask can be constructed by or'ing together the bits listed above for the `CURL.SetOptionHTTPOAuth` option. As of this writing, only Basic, Digest and NTLM work. See also [PROXYAUTH](#) option in CURL manual.

61.280 `CURL.SetOptionProxyCAInfo`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyCAInfo"; curl; Path)

Parameters

curl

The CURL session handle.

\$curl

Path

The native file path.

Result Returns OK or error.

Description

This option is used only if `CURL.SetOptionProxySSLVerifyPeer` is true

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer. See also [PROXY_CAINFO](#) option in CURL manual.

MBS("CURL.SetOptionProxyCRLFile"; curl; Path)

Parameters

curl

The CURL session handle.

\$curl

Path

The native file path to the file.

Result Returns OK or error.

Description

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer. See also [PROXY_CRLFILE](#) option in CURL manual.

61.285 CURL.SetOptionProxyPassword

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyPassword"; curl; Value { ; Encoding })

Parameters**curl**

The CURL session handle.

\$curl

Value

The password text.

"pass123"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

Please use `CURL.SetOptionProxyUsername` to set username.

See also [PROXYPASSWORD](#) option in CURL manual.

61.286 `CURL.SetOptionProxyPinnedPublicKey`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyPinnedPublicKey"; curl; Path)

Parameters

curl

The CURL session handle.

\$curl

Path

The file path.

Result Returns OK or error.

Description

The public key in DER form used to validate the proxy public key. This option is used only if `CURL.SetOptionProxySSLVerifyPeer` is true. Please path native file path to key file.

This function requires a native path. Use `Path.FileMakerPathToNativePath` to convert a FileMaker path to a native path if required. If you like to have the user choose the path, you can use `FileDialog` functions. For Server be aware that server has limited permissions and may not be able to access all files on a computer. 61.287 CURL.SetOptionProxyPort

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyPort"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The new port value.

8080

Result Returns "OK" on success.

Description

See also [PROXYPORT](#) option in CURL manual.

Examples

Set proxy with explicit port:

```
Set Variable [ $r; MBS( "CURL.SetOptionProxy"; $curl; "http://cache.local.com/" ) ]
```

```
Set Variable [ $r; MBS( "CURL.SetOptionProxyPort"; $curl; 8000 ) ]
```

61.296 `CURL.SetOptionProxySSLVersion`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.2	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxySSLVersion"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The option value.

Result Returns OK or error.

Description

The SSL and TLS versions have typically developed from the most insecure version to be more and more secure in this order through history: SSL v2, SSLv3, TLS v1.0, TLS v1.1, TLS v1.2 and the most recent TLS v1.3.

Use one of the available defines for this purpose. The available options are:

Default	0	The default acceptable version range. The minimum acceptable version is by default TLS v1.0 since 7.39.0 (unless the TLS library has a stricter rule).
TLSv1	1	TLS v1.0 or later
SSLv2	2	SSL v2 (but not SSLv3)
SSLv3	3	SSL v3 (but not SSLv2)
TLSv1.0	4	TLS v1.0 or later (Added in 7.34.0)
TLSv1.1	5	TLS v1.1 or later (Added in 7.34.0)
TLSv1.2	6	TLS v1.2 or later (Added in 7.34.0)
TLSv1.3	7	TLS v1.3 or later (Added in 7.52.0)

See also `kSSLVersion*` constants.

The maximum TLS version can be set by using one of the `CURL_SSLVERSION_MAX_` macros below. It is also possible to OR one of the `CURL_SSLVERSION_` macros with one of the `CURL_SSLVERSION_MAX_` macros.

Please note that MBS Plugin does not yet support TLS v1.3 now, but may in future. See also [PROXY_SSLVERSION](#) option in CURL manual.

61.296. *CURL.SETOPTIONPROXYSSLVERSION* 2191

Default	65536	The flag defines the maximum supported TLS version by libcurl, or the default value from the SSL library is used. libcurl will use a sensible default maximum, which was TLS v1.2 up to before 7.61.0 and is TLS v1.3 since then - assuming the TLS library support it. (Added in 7.54.0)
Max TLSv1.0	262144	The flag defines maximum supported TLS version as TLS v1.0. (Added in 7.54.0)
Max TLSv1.1	327680	The flag defines maximum supported TLS version as TLS v1.1. (Added in 7.54.0)
Max TLSv1.2	393216	The flag defines maximum supported TLS version as TLS v1.2. (Added in 7.54.0)
Max TLSv1.3	458752	The flag defines maximum supported TLS version as TLS v1.3. (Added in 7.54.0)

61.298 CURL.SetOptionProxyTLS13Ciphers

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	8.3	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyTLS13Ciphers"; curl; Ciphers)

Parameters**curl**

The CURL session handle.

\$curl

Ciphers

The list of ciphers.

Result Returns OK or error.

Description

The list of cipher suites to use for the TLS 1.3 connection to a proxy. The list must be syntactically correct, it consists of one or more cipher suite strings separated by colons.

You'll find more details about cipher lists on this URL:

<https://curl.haxx.se/docs/ssl-ciphers.html>

The application does not have to keep the string around after setting this option.

1

Result Returns "OK" on success.

Description

If the value is set to 1 (one), it tells libcurl to set the transfer mode (binary or ASCII) for FTP transfers done via an HTTP proxy, by appending ;type=a or ;type=i to the URL. Without this setting, or it being set to 0 (zero, the default), `CURL.SetOptionTransferText` has no effect when doing FTP via a proxy. Beware that not all proxies support this feature.

See also [PROXY_TRANSFER_MODE](#) option in CURL manual.

61.303 `CURL.SetOptionProxyType`

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyType"; curl; Value)

Parameters

curl

The CURL session handle.

\$curl

Value

The proxy type. Pass number listed below, e.g. 1 for `CURLPROXY_HTTP_1_0`.

1

Result Returns "OK" on success.

Description

Available options for this are `CURLPROXY_HTTP` (0), `CURLPROXY_HTTP_1_0` (1), `CURLPROXY SOCKS4` (4), `CURLPROXY SOCKS5` (5), `CURLPROXY SOCKS4A` (6) and `CURLPROXY SOCKS5_HOST-NAME` (7). The HTTP type is default.

If you set proxy type to `CURLPROXY_HTTP_1_0` (0), it will only affect how libcurl speaks to a proxy when `CONNECT` is used. The HTTP version used for "regular" HTTP requests is instead controlled with `CURL.SetOptionHTTPVersion`.

See also [PROXYTYPE](#) option in CURL manual.

Examples

Set Socks 5 proxy:

```
MBS( "CURL.SetOptionProxyType"; $curl; 5 )
```

61.304 CURL.SetOptionProxyUsername

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionProxyUsername"; curl; Value { ; Encoding })

Parameters

curl

The CURL session handle.

\$curl

Value

The user name.

"testuser"

Encoding

Optional

The text encoding for text parameter. Default is UTF-8.

"UTF8"

Result Returns "OK" on success.

Description

In order to specify the password to be used in conjunction with the user name use the CURL.SetOptionProxyPassword option.

See also [PROXYUSERNAME](#) option in CURL manual.

61.305 CURL.SetOptionPut

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionPut"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

Whether this is a PUT request.

1

Result Returns "OK" on success.

Description

A parameter set to 1 tells the library to use HTTP PUT to transfer data. The data should be set with `CURL.SetInputText` or other functions.

This option is deprecated and starting with version 7.12.1 you should instead use `CURL.SetOptionUpload`. See also **PUT** option in CURL manual.

Examples

Turns put on:

```
MBS( "CURL.SetOptionPut"; $curl; 1 )
```

Make request with PUT:

```
Set Variable [ $curl; Value:MBS("CURL.New") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionURL"; $curl; "http://test.test/test/hello.txt") ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUpload"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPut"; $curl; 1) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionPassword"; $curl; CURL Test::Password) ]
Set Variable [ $result; Value:MBS("CURL.SetOptionUsername"; $curl; CURL Test::Name) ]
Set Variable [ $result; Value:MBS("CURL.SetInputText"; $curl; "This is content to upload") ]
# run
Set Field [ CURL Test::Result; MBS("CURL.Perform"; $curl) ]
# check results
Set Field [ CURL Test::debug; MBS("CURL.GetDebugAsText"; $curl) ]
Set Variable [ $result; Value:MBS("CURL.Cleanup"; $curl) ]
```

61.306 CURL.SetOptionQuote

Component	Version	macOS	Windows	Server	FileMaker Cloud	FileMaker iOS SDK
61 CURL	2.5	Yes	Yes	Yes	Yes	Yes

MBS("CURL.SetOptionQuote"; curl; Value)

Parameters**curl**

The CURL session handle.

\$curl

Value

The ftp commands.

"mkdir testfolder"

Result Returns "OK" on success.

Description

This will be done before any other commands are issued (even before the CWD command for FTP). Disable this operation again by passing no value to this function. When speaking to a FTP (or SFTP) server, prefix the command with an asterisk (*) to make libcurl continue even if the command fails as by default libcurl will stop at first failure.

The set of valid FTP commands depends on the server (see RFC 959 for a list of mandatory commands).

The valid SFTP commands are: chgrp, chmod, chown, ln, mkdir, pwd, rename, rm, rmdir, symlink.

This option takes a list of items. So this function takes a variable number of arguments. If you call function with 2 parameters, you set an empty list. If you call it with 5 parameters, you set a list with 3 values.

See also `CURL.SetOptionPreQuote` and `CURL.SetOptionPostQuote`.

Here is list of raw FTP commands:
